CHM1 Atomic Structure, Bonding, and Periodicity

Mark Scheme

2007 Examination – January series

Mark schemes are prepared by the Principal Examiner and considered, together with the relevant questions, by a panel of subject teachers. This mark scheme includes any amendments made at the standardisation meeting attended by all examiners and is the scheme which was used by them in this examination. The standardisation meeting ensures that the mark scheme covers the candidates' responses to questions and that every examiner understands and applies it in the same correct way. As preparation for the standardisation meeting each examiner analyses a number of candidates' scripts: alternative answers not already covered by the mark scheme are discussed at the meeting and legislated for. If, after this meeting, examiners encounter unusual answers which have not been discussed at the meeting they are required to refer these to the Principal Examiner.

It must be stressed that a mark scheme is a working document, in many cases further developed and expanded on the basis of candidates' reactions to a particular paper. Assumptions about future mark schemes on the basis of one year's document should be avoided; whilst the guiding principles of assessment remain constant, details will change, depending on the content of a particular examination paper.

Set and published by the Assessment and Qualifications Alliance.

The Assessment and Qualifications Alliance (AQA) is a company limited by guarantee registered in England and Wales (company number 3644723) and a registered charity (registered charity number 1073334).

Question 1

(a)

	relative mass	**and**	relative charge	
Proton	1		+1	1
Electron	1/1800		-1	1

Accept < 5.6×10^{-4} / negligible / 0

(b) ^{38}Ar mass number *[allow separate 38]* 1
element 1
[Not AR] [M1: Not 38.0 / M2 Not symbol with a charge]
[Wrong proton number = 'con' for M2] [$_{38}A_r$ scores 1 mark]

(c) (i) $1s^2 2s^2 2p^6$ 1
[Allow upper case letters and subscripted numbers] [Not [He]$2s^2$ $2p^6$]

(ii) More protons / atomic number / proton number /higher or stronger nuclear charge
Al^{3+} smaller (size) than Na^+ / e^- closer to nucleus
More attraction for e^- from / e^- held/pulled more strongly by Al^{3+}
any 2 points 2

[M3 Al^{3+} may be inferred] [M2 Not 'atomic radius' / 'atom'/ 'molecule' = 'con']
Greater charge density/charge-size ratio = alternative for either M1 or M2 but not for both]

(d) (i) High energy/speed electrons / electrons from an electron gun / electron gun fires e^- 1
Knock off/displaces/removes an electron/electrons (from the gaseous atom) 1
[Accept correct equation for M2]

(ii) Electric field / -ve plate / electrostatic field/oppositely charged plates 1
[Not electronic field; magnetic field / electric current/high pd/high voltage]

(e) $\frac{(194 \times 32.8) + (195 \times 30.6) + (196 \times 25.4) + (198 \times 11.2)}{100}$ 1
= 195.3 (1 d.p. only)
[Mark M2 conseq. on transcription error]

Question 2

(a) (i) $21.7 \times 10^{-3} \times 0.150 = 3.255 \times 10^{-3}$ (mol) 1
[Accept 3.25 – 3.26 $\times 10^{-3}$]

(ii) In 25 cm^3 = $(3.255 \times 10^{-3})/2$ = 1.63×10^{-3} (mol) *[Conseq on (i)]* 1
In sample = 1.63×10^{-2} *[Conseq on (ii)]* 1

(iii) = $1.92 / 1.63 \times 10^{-2}$ *[Process mark]* 1
= 117.9 = 118 *[Conseq on (ii)]* ***[M5 Tied to M4]*** 1
[Accept 117.7 – 118.2]
[If '÷ 2' not done in M2, CE = 0 for M2 and M5]
[If 1.63×10^{-3} used in (a)(iii), lose M3 only]

(b) (i) Simplest/lowest ratio of atoms of each element (in a compound) 1
QoL *[Allow 'elements' for 'each element] ['atoms' needed in molar definitions]*
*[Not atoms of **<u>an</u>** element]*

(ii)

C	**H**	**O**
49.31	6.85	43.84
12	1	16
4.11	6.85	2.74
1.5	2.5	1

Ratio 3 5 2 or $C_3H_5O_2$ 1

[If any A_r value used is wrong / calculation inverted = CE = 0]
= $C_3H_5O_2 \times 146/73$ = $C_6H_{10}O_4$ 1
[If transcription error in % data, allow M1 only]
[Not $(C_3H_5O_2)_2$]

(c) (i) pV = nRT 1

$= \frac{pV}{RT} = \frac{100000 \times 352 \times 10^{-6}}{8.31 \times 298}$ *[volume conversion]* 1
[numbers correct] 1

Moles CO_2 = 0.0142 (mol) 1
[If transcription error, lose M3 – so, '325' loses M2 (no conversion) and M3 (transcription error)]
[If expression inverted (i.e. RT/pV calculated) = CE = 0 for M3 and M4]

Moles $NaHCO_3 = 0.0142 \times 2$ (= 0.0284 (mol)) *[Process]* 1

Mass $NaHCO_3 = 84 \times 0.0284$ *[mark for the M_r] [accept correct 'string']* 1

= 2.38 - 2.39 g *[Conseq on M_r error]* 1
[If '× 2' not used – i.e. M5 = 0, then CE and M7 is also lost. Can get M6 for M_r]
Answers using 0.0230 mol:
Moles $NaHCO_3$ = 0.0460 Mass = 3.86-3.87
[Sig figs for <u>whole</u> question. For <3 sf (unless 2sf dead) award 1 mark penalty ONLY for sf errors]

Question 3

(a) (i) (A covalent bond in which) the electron density is/electrons are unequally shared. 1
[Allow idea of $\delta+$ and $\delta-$ across bond / charge separation / bonding pair / e^-s closer to one atom] [accept clear diagram]
[Not electron cloud unless clearly describing a covalent bond]

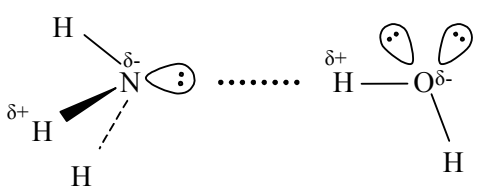
(ii) Bonds in hydrogen non-polar
Bonds in water polar *[need both]* 1
[If bond types reversed, lose M1, not CE]

Atoms in a non-polar bond / in H_2 have <u>the same electronegativity</u> 1

Atoms in a polar bond have <u>different electronegativities</u> **Or** 1
O more/very electronegative / has different electronegativity than H

[Allow M1 in 'Explanation' section if gaps in bond type section]
[If 'gaps' and bond types not identified in explanation, allow 1 mark for H_2 has no electronegativity diff. but H and O have electronegativity diff.]
[If M1 = wrong, e.g. van der Waals' etc, then CE = 0]

(b) (i) At least one dipole on each molecule 1



Lone pair on N **and** H-Bond correctly indicated *[Not arrows or solid lines]* 1
Two lone pairs on oxygen 1
[An extra, incorrect, hydrogen bond contradicts a correct one]

(ii) Bond angle in ammonia = 106.5°-107.5° 1
Idea that lone pair repulsion > bonding pair repulsion 1
Oxygen/water has more lone pairs than nitrogen/ammonia 1
Mark points independently

(c) Type of bond = Dative bond / coordinate bond 1
Lone pair donated from/by N (to Al) / N provides both electrons 1
[Accept NH_3 in place of N]

Question 4

(a) Least soluble hydroxide = $Mg(OH)_2$ 1

(b) (i) $BaCl_2$ / any soluble barium cpd **Or** $AgNO_3$ / any soluble silver cpd 1
[If formula used, must be correct] [Not Ba^{2+} ions / Ba element]
[If 'impossible' reagent, e.g. $BaSO_4$ or NaOH, = CE = 0]

(ii) Obs with NaCl = no change/ppt/reaction **Or** white ppt etc*. 1

Obs with Na_2SO_4 = white ppt* /solid **Or** no change etc. 1

Equation = $Ba^{2+} + SO_4^{2-} \rightarrow BaSO_4$ **Or** $Ag^+ + Cl^- \rightarrow AgCl$ 1

[If Ba / Ba^{2+}/ wrong formula – i.e. M1 lost but not 'impossible' reagent, allow M2/3/4]

[Allow full credit for a valid test for Cl^- ions – the points below apply]

[If no reagent given but Ba^{2+} / $BaCl_2$ in equation, allow credit for M2/3/4]

[Ignore state symbols in the equation – even if wrong]

*[*ppt or solid or powder or suspension]*

[Not cloudy, milky, emulsion, residue, opaque]

[Not nothing / no observations / none]

Question 5

Diagram: Na^+ and Cl^- ions correctly placed in 2D (Min 4 ions) 1
Cubic – min 8 ions (or 7 with hidden ion) 1

[Looking for shape, so ignore missing charges]
[Accept circles with '+' and '-' / different size circles / different coloured circles]

Opposite-ion/electrostatic attractions / forces *[Not electrostatic bonds]* 1
are strong / difficult to break / overcome / loosen 1

[Accept 'strong ionic bonding' for 1 mark]
[Accept high energy needed to overcome attractions in place of 'strong']
[Not just high energy needed to melt NaCl]
[atoms / molecules / IMFs / covalent / delocalised e^- = CE= 0]

Conducts only when molten or in aqueous solution 1
As ions can move. 1
[Mark M5 / M6 separately

Question 6

(a) Atomic radius decreases 1
[If trend wrong = CE = 0] [If trend blank award M2 /M3 / M4 on merit]

Increase in number of protons / atomic number / nuclear charge 1

Same shells / energy level / shielding / screening
[Accept similar shielding] 1

QoL Increase in attraction/pull between nucleus and outer electrons 1

(b) Energy/enthalpy change when one electron is removed 1
from a gaseous atom 1
[Molar definitions must have reference to 'atoms']

General trend = increasing 1
[Do NOT treat wrong trend as CE but comparisons with Mg / P must be emphatic – i.e. IE of Al is much lower than that of Mg]

Deviation:

first IE of Al is low / < Mg	**M4**	first IE of S is low / < P	1
(Outer) e^- *(singular)* in 3p/p orbital / p sublevel	**M5**	(e^- removed from) e^- pair in 3p / p orbital / p sublevel	1
In higher energy orbital/sub-level Or e^- further from nucleus Or shielding/screened by 3s	**M6**	repulsion between these paired e^- *['e^- pair' may be inferred]*	1

Mark part (b) to 5 max

[If both Al and S described, mark both and award higher mark – cross out rejected answer]
[If not Al / S then CE for M4/5/6]
