General Certificate of Education January 2003 Advanced Subsidiary Examination

### **CHEMISTRY** CHM1 Unit 1 **Atomic Structure, Bonding and Periodicity**

Friday 10 January 2003 Morning Session

In addition to this paper you will require: a calculator.

Time allowed: 1 hour 30 minutes

### **Instructions**

- Use blue or black ink or ball-point pen.
- Fill in the boxes at the top of this page.
- Answer all questions in **Section A** and **Section B** in the spaces provided. All working must be shown.
- Do all rough work in this book. Cross through any work you do not want marked.
- The Periodic Table/Data Sheet is provided on pages 3 and 4. Detach this perforated sheet at the start of the examination.

# **Information**

- The maximum mark for this paper is 90.
- Mark allocations are shown in brackets.
- This paper carries 30 per cent of the total marks for AS. For Advanced Level this paper carries 15 per cent of the total marks.
- You are expected to use a calculator where appropriate.
- The following data may be required. Gas constant  $R = 8.31 \,\mathrm{J \, K^{-1} \, mol^{-1}}$
- Your answers to questions in **Section B** should be written in continuous prose, where appropriate. You will be assessed on your ability to use an appropriate form and style of writing, to organise relevant information clearly and coherently, and to use specialist vocabulary, where appropriate.

# **Advice**

• You are advised to spend about 1 hour on Section A and about 30 minutes on **Section B**.

# **SECTION A**

Answer all questions in the spaces provided.

(a) Complete the following table.

Particle	Relative charge	Relative mass
Proton		
Neutron		
Electron		

(3 marks)

(b)	An atom of element $\mathbf{Z}$ has two more protons and two more neutrons than an atom of $^{34}_{16}\mathrm{S}$ . Give the symbol, including mass number and atomic number, for this atom of $\mathbf{Z}$ .
	(2 marks)
(c)	Complete the electronic configurations for the sulphur atom, $S$ , and the sulphide ion, $S^{2-}$ .
	S 1s <sup>2</sup>
	S <sup>2-</sup> 1s <sup>2</sup>
	(2 marks)
(d)	State the block in the Periodic Table in which sulphur is placed and explain your answer.
	Block
	Explanation
	(2 marks)

# The Periodic Table of the Elements

The atomic numbers and approximate relative atomic masses shown in the table are for use in the examination unless stated otherwise in an individual question.

O—H (alcohols)	3230–3550
O—H (acids)	2500–3000

(e)		um sulphide, Na <sub>2</sub> S, is a high melting point solid which conducts electricity when en. Carbon disulphide, CS <sub>2</sub> , is a liquid which does not conduct electricity.
	(i)	Deduce the type of bonding present in Na <sub>2</sub> S and that present in CS <sub>2</sub>
		Bonding in Na <sub>2</sub> S
		Bonding in CS <sub>2</sub>
	(ii)	By reference to all the atoms involved explain, in terms of electrons, how $Na_2S$ is formed from its atoms.
	(iii)	Draw a diagram, including all the outer electrons, to represent the bonding present in $\ensuremath{\text{CS}}_2$
	(iv)	When heated with steam, $CS_2$ reacts to form hydrogen sulphide, $H_2S$ , and carbon dioxide. Write an equation for this reaction.
		(7 marks)

TURN OVER FOR THE NEXT QUESTION

2	(a)		ulate the concentration, in mol dm <sup>-3</sup> , of the solution formed when 19.6 g of ogen chloride, HCl, are dissolved in water and the volume made up to 250 cm <sup>3</sup> .
		•••••	
		•••••	
		•••••	(3 marks)
	(b)		carbonate of metal $\mathbf{M}$ has the formula $M_2CO_3$ . The equation for the reaction of this onate with hydrochloric acid is given below.
			$M_2CO_3 + 2HCl \longrightarrow 2MCl + CO_2 + H_2O$
		A sa 0.263	ample of $M_2CO_3$ , of mass 0.394 g, required the addition of 21.7 cm <sup>3</sup> of a $^3$ mol dm <sup>-3</sup> solution of hydrochloric acid for complete reaction.
		(i)	Calculate the number of moles of hydrochloric acid used.
		(ii)	Calculate the number of moles of M <sub>2</sub> CO <sub>3</sub> in 0.394 g.
		(iii)	Calculate the relative molecular mass of M <sub>2</sub> CO <sub>3</sub>
		(iv)	Deduce the relative atomic mass of <b>M</b> and hence suggest its identity.
			Relative atomic mass of <b>M</b>
			Identity of M
			(6 marks)

6

voiui	me of $2.34 \times 10^{-4}$ m <sup>3</sup> at a pressure of 110 kPa and a temperature of 473 K.
(a)	Give the name of the equation $pV = nRT$ .
	(1 mark)
(b)	Use the equation $pV = nRT$ to calculate the number of moles of <b>X</b> in the sample and hence deduce the relative molecular mass of <b>X</b> . (The gas constant $R = 8.31 \mathrm{J}\mathrm{K}^{-1}\mathrm{mol}^{-1}$ )
	Moles of X
	Relative molecular mass of X
	(4 marks)
(c)	Compound <b>X</b> , which contains carbon, hydrogen and oxygen only, has 38.7% carbon and 9.68% hydrogen by mass. Calculate the empirical formula of <b>X</b> .
	(3 marks)
(d)	Using your answers to parts (b) and (c) above, deduce the molecular formula of <b>X</b> .
	(1 mark)

There is a general trend in the values of the first ionisation energies of the elements Na to Ar.

me	first ionisation energies of the elements AI and S deviate from this trend.
(a)	Write an equation, including state symbols, to represent the process for which the energy change is the first ionisation energy of Na.
	(2 marks)
(b)	State and explain the general trend in the values of the first ionisation energies of the elements Na to Ar.
	Trend
	Explanation
	(3 marks)
(c)	State how, and explain why, the values of the first ionisation energies of the elements Al and S deviate from the general trend.
	How the values deviate from the trend
	Explanation for Al
	Explanation for S
	(5 marks)

## **SECTION B**

Answer **both** questions below in the space provided on pages 12 to 16 of this booklet.

- 6 Ionisation is the first of the four main stages involved in obtaining the mass spectrum of a sample of gaseous titanium atoms. Explain how ionisation is achieved. Name the remaining three stages and, in each case, state how each stage is achieved. Explain why it would be difficult to distinguish between <sup>48</sup>Ti<sup>2+</sup> and <sup>24</sup>Mg<sup>+</sup> ions using a mass (10 marks) spectrometer.
  - (b) State any differences and similarities in the atomic structure of the isotopes of an element. State the difference, if any, in the chemistry of these isotopes. Explain your answer. (4 marks)
  - The table below gives the percentage abundance of each isotope in the mass spectrum of a sample of titanium.

m/z	46	47	48	49	50
% abundance	8.02	7.31	73.81	5.54	5.32

Define the term *relative atomic mass* of an element. Use the above data to calculate the value of the relative atomic mass of titanium in this sample. Give your answer to two decimal places. (4 marks)

- Predict the shapes of the SF<sub>6</sub> molecule and the AlCl<sub>4</sub> ion. Draw diagrams of these species to show their three-dimensional shapes. Name the shapes and suggest values for the bond angles. Explain your reasoning. (8 marks)
  - (b) Perfume is a mixture of fragrant compounds dissolved in a volatile solvent.

When applied to the skin the solvent evaporates, causing the skin to cool for a short time. After a while, the fragrance may be detected some distance away. Explain these observations. (4 marks)

# **END OF QUESTIONS**
