General Certificate of Education June 2005 Advanced Subsidiary Examination

CHEMISTRY CHM1 Unit 1 Atomic Structure, Bonding and Periodicity

Wednesday 8 June 2005 Morning Session

In addition to this paper you will require: a calculator.

Time allowed: 1 hour

Instructions

- Use blue or black ink or ball-point pen.
- Fill in the boxes at the top of this page.
- Answer all questions in Section A and Section B in the spaces provided.
 All working must be shown.
- Do all rough work in this book. Cross through any work you do not want marked.
- The Periodic Table/Data Sheet is provided on pages 3 and 4. Detach this perforated sheet at the start of the examination.

Information

- The maximum mark for this paper is 60.
- Mark allocations are shown in brackets.
- This paper carries 30 per cent of the total marks for AS. For Advanced Level this paper carries 15 per cent of the total marks.
- You are expected to use a calculator where appropriate.
- The following data may be required. Gas constant $R = 8.31 \,\mathrm{J \, K^{-1} \, mol^{-1}}$
- Your answers to the questions in **Section B** should be written in continuous prose, where appropriate. You will be assessed on your ability to use an appropriate form and style of writing, to organise relevant information clearly and coherently, and to use specialist vocabulary, where appropriate.

Advice

• You are advised to spend about 45 minutes on **Section A** and about 15 minutes on **Section B**.

SECTION A

2

Answer all questions in the spaces provided.

(a)		relative abundances of these isotone mass spectrometer, the sample				
	(i)	State what is meant by the term				
	(ii)	Explain how, in a mass spectron is measured.	neter, ion	s are det	ected and	I how their abundance
		How ions are detected				
		How abundance is measured				
						(5 marks)
(b)	(i)	Define the term relative atomic	mass of a	ın elemen	ıt.	
	(ii)	The relative abundances of the follows.	isotopes i	n this san	nple of iro	on were found to be as
		m/z	54	56	57	
		Relative abundance (%)	5.8	91.6	2.6	
		Use the data above to calculat Give your answer to one decim		ntive aton	nic mass	of iron in this sample.
			•••••			

The Periodic Table of the Elements

The atomic numbers and approximate relative atomic masses shown in the table are for use in the examination unless stated otherwise in an individual question.

2 (a) Lead(II) nitrate may be produced by the reaction between nitric acid and lead(II) oxide as shown by the equation below.

$$PbO + 2HNO_3 \rightarrow Pb(NO_3)_2 + H_2O$$

An excess of lead(II) oxide was allowed to rea Calculate the maximum mass of lead(II) nitreaction.	
	(4 marks)

(b) An equation representing the thermal decomposition of lead(II) nitrate is shown below.

$$2Pb(NO_3)_2(s) \ \to \ 2PbO(s) \ + \ 4NO_2(g) \ + \ O_2(g)$$

A sample of lead(II) nitrate was heated until the decomposition was complete. At a temperature of 500 K and a pressure of 100 kPa, the total volume of the gaseous mixture produced was found to be $1.50\times10^{-4}\,\mathrm{m}^3$.

(i) State the ideal gas equation and use it to calculate the total number of moles of gas produced in this decomposition.

(The consequent R = 8.21 LV⁻¹ mol⁻¹)

(The gas constant $R = 8.31 \,\mathrm{J \, K^{-1} \, mol^{-1}}$)

(ii)	Deduce the number of moles, and the mass, of NO_2 present in this gaseous mixture. (If you have been unable to calculate the total number of moles of gas in part (b)(i), you should assume this to be 2.23×10^{-3} mol. This is not the correct answer.)
	Number of moles of NO ₂
	Mass of NO ₂
	(7 marks)

5 (a) Methanol has the structure

Explain why the O–H bond in a methanol molecule is polar.
(2 marks)

(b) The boiling point of methanol is $+65\,^{\circ}\text{C}$; the boiling point of oxygen is $-183\,^{\circ}\text{C}$. Methanol and oxygen each have an M_{r} value of 32. Explain, in terms of the intermolecular forces present in each case, why the boiling point of methanol is much higher than that of oxygen.

(3 marks)

SECTION B

Answer the questions below in the space provided on pages 11 to 16 of this booklet.

6 Diamond and graphite are both forms of carbon.

Diamond is able to scratch almost all other substances, whereas graphite may be used as a lubricant

Diamond and graphite both have high melting points.

Explain each of these properties of diamond and graphite in terms of structure and bonding. Give **one** other difference in the properties of diamond and graphite.

(9 marks)

7 This question concerns the chemistry of the Group II metals Mg to Ba.

An aqueous solution of a Group II metal chloride **XCl.** forms a white pred

An aqueous solution of a Group II metal chloride, $\mathbf{X}Cl_2$, forms a white precipitate when dilute aqueous sodium hydroxide is added. A separate sample of the solution of $\mathbf{X}Cl_2$ does **not** form a precipitate when dilute aqueous sodium sulphate is added.

An aqueous solution of a different Group II metal chloride, **Y**Cl₂, does **not** form a precipitate when dilute aqueous sodium hydroxide is added. A separate sample of the solution of **Y**Cl₂ forms a white precipitate when dilute aqueous sodium sulphate is added.

Suggest identities for the Group II metals **X** and **Y**. Write equations, including state symbols, for the reactions which occur.

(6 marks)
