General Certificate of Education June 2006 Advanced Subsidiary Examination

CHEMISTRY CHM3/P Unit 3(b) Practical Examination

9.00 am to 11.00 am

•

# For this paper you must have

Thursday 18 May 2006

· a calculator.

Time allowed: 2 hours

### **Instructions**

- Use blue or black ink or ball-point pen.
- Fill in the boxes at the top of this page.
- Carry out all three exercises.
- Answer all questions.
- Answer questions in the spaces provided. All working must be shown.
- Do all rough work in this book. Cross through any work you do not want marked.
- Take careful note of all the instructions given in each exercise.
- The Periodic Table/Data Sheet is provided on pages 3 and 4. Detach this perforated sheet at the start of the examination.

# **Information**

- You must **not** use note books and laboratory books.
- The maximum mark for this paper is 30.
- The skills which are being assessed are
  - **Skill 1** Planning (8 marks)
  - **Skill 2** Implementing (8 marks)
  - **Skill 3** Analysing (8 marks)
  - **Skill 4** Evaluating (6 marks)
- You will be assessed on your ability to use an appropriate form and style of writing, to organise relevant information clearly and coherently, and to use specialist vocabulary, where appropriate.

# **Advice**

- You are advised to spend about 40 minutes on each of the three exercises.
- You are advised to carry out Exercise 1 first.

This paper consists of the following.

Exercise 1 Implementing and Analysing Determination of the temperature rise during a

neutralisation reaction

Exercise 2 Analysing and Evaluating Determination of the relative molecular mass,  $M_r$ ,

of a volatile liquid

Exercise 3 Planning The relative molecular mass,  $M_r$ , of a Group I metal

carbonate.

An essential part of any practical work is to plan for the most efficient use of the time available. There is enough time to complete the exercises set provided that a sensible approach is used.

You are advised to spend approximately

40 minutes on Exercise 1

40 minutes on Exercise 2

40 minutes on Exercise 3

# The Periodic Table of the Elements

■ The atomic numbers and approximate relative atomic masses shown in the table are for use in the examination unless stated otherwise in an individual question.

Turn over for the first exercise

Exercise 1 Determination of the temperature rise during a neutralisation reaction

**Skills assessed Implementing** (8 marks) **and Analysing** (2 marks)

### Introduction

You are provided with aqueous solutions of nitric acid and sodium hydroxide. The concentration of both solutions is 1.00 mol dm<sup>-3</sup>. You are required to determine the temperature rise for the neutralisation of a sample of nitric acid by sodium hydroxide.

Wear eye protection at all times. Assume that all solutions are toxic and corrosive.

### **Procedure**

- 1 Rinse a burette with the nitric acid provided. Set up the burette and, using a funnel, fill it with the nitric acid provided.
- 2 Using the burette, transfer 25.0 cm<sup>3</sup> of the nitric acid to a clean, dry plastic cup.
- 3 Measure the temperature of the nitric acid in the cup to one decimal place. Record your result.

Temperature of the nitric acid/°C
-----------------------------------

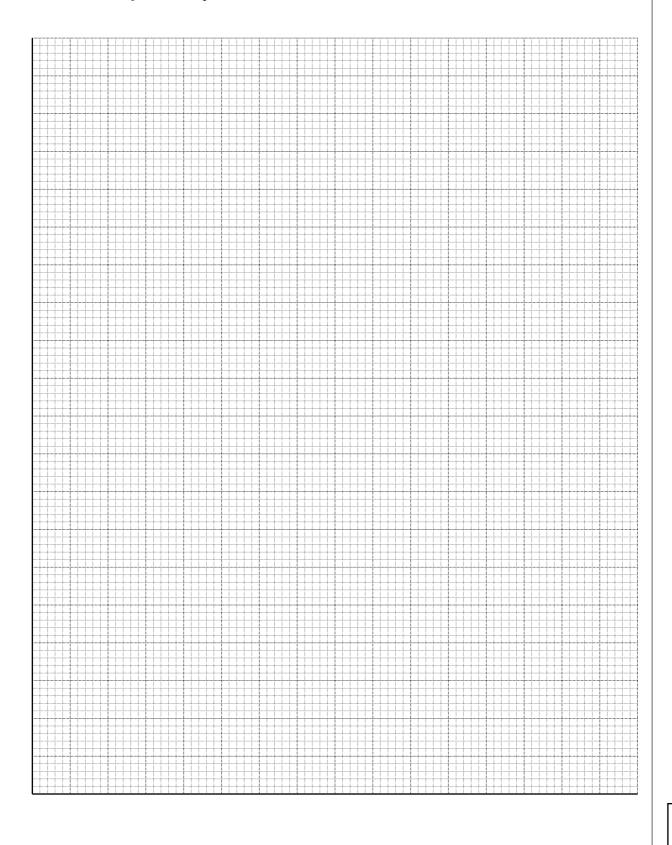

- 4 Wash the thermometer with distilled or de-ionised water and dry the thermometer.
- 5 Rinse a pipette with the sodium hydroxide solution provided. Using this pipette and a filler, transfer 25.0 cm<sup>3</sup> of the sodium hydroxide solution to a second clean, dry plastic cup.
- 6 Place the plastic cup containing the sodium hydroxide solution in a beaker to provide support and additional insulation. Mount the thermometer in the cup using a clamp and stand. The bulb of the thermometer must be fully immersed in the solution. Place a stirrer in the cup.
- 7 Stir the sodium hydroxide solution in the cup and measure the temperature to one decimal place. Record your result in the table below. Every minute for a further three minutes stir the solution, measure the temperature and record each result in the table.
- 8 At the fourth minute add the 25.0 cm<sup>3</sup> of nitric acid from the plastic cup. Stir the mixture but do not record the temperature.
- 9 Continue to stir the mixture, and measure the temperature at the fifth minute, and then every subsequent minute up to ten minutes. Record each temperature in the table.

Time/minutes	0	1	2	3	4	5	6	7	8	9	10
Temperature/°C											

For Ex	kaminer	's use o	only
M		P	
R		A	

10 Plot a graph of **temperature** (*y*-axis) against **time** (*x*-axis) on the graph paper below. Draw a line of best fit for the points before the fourth minute. Draw a second line of best fit for the points after the fourth minute. Extrapolate both lines to the fourth minute. Hence determine an accurate value for the temperature rise at the fourth minute.

Accurate value for the temperature rise ......°C

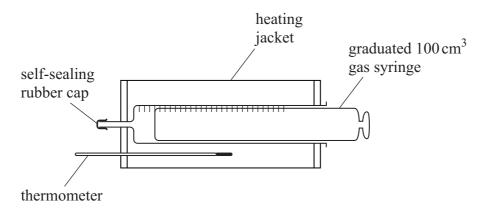

**Exercise 2** Determination of the relative molecular mass,  $M_r$ , of a volatile liquid

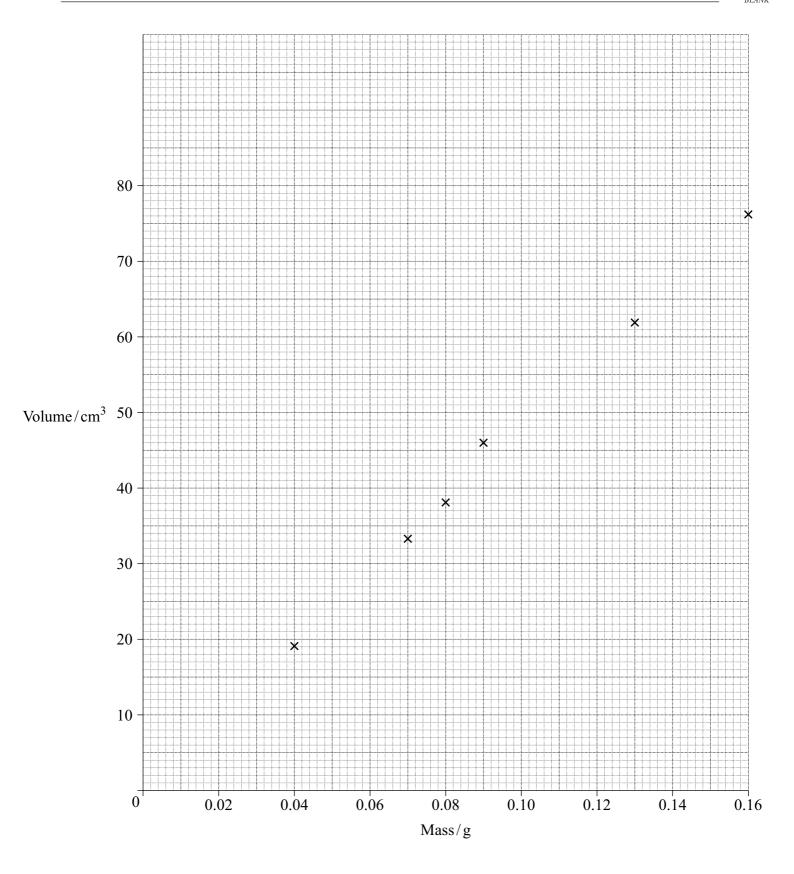

**Skills assessed** Analysing (6 marks) and Evaluating (6 marks)

# Introduction

Compound X is a volatile liquid. In order to determine the relative molecular mass,  $M_r$ , of X, a student carried out six experiments. In each experiment a measured mass of X was injected into an empty  $100 \, \text{cm}^3$  gas syringe maintained at a pressure of  $100 \, \text{kPa}$  and a temperature of  $373 \, \text{K}$ . In each of the six experiments the volume of gas produced was measured. The student's results are shown on the graph on page 9.

The apparatus used is shown in the diagram below.

Anal	lysis Full marks can only be scored if you show all your working.
1	Draw a best fit straight line on the graph.
2	Use the graph to determine the volume of gas which would have been produced by $0.10\mathrm{g}$ of $\mathbf{X}$ .
	Volume of gas
3	State the ideal gas equation.
4	Use your answers to part (2) and part (3) to calculate the $M_{\rm r}$ of <b>X</b> ( $R = 8.31  {\rm J  K^{-1}  mol^{-1}}$ ).
5	Assume the maximum errors for the apparatus used in this experiment were
	balance $\pm 0.01 \mathrm{g}$
	gas syringe $\pm 1 \mathrm{cm}^3$
	Estimate the maximum percentage error in using each piece of apparatus, and hence calculate the overall apparatus error. Use a mass of 0.10 g and the volume from part (2) to calculate these errors.

# **Evaluation** Full marks can only be scored if you show all your working.

1	Consider the graph and comment on the accuracy of the results obtained by the student. Is your line of best fit good enough for you to use with confidence? Identify any anomalous results.
2	The correct value for the relative molecular mass of <b>X</b> is 72.0. Calculate the difference between the student's value and this correct value. Express this difference as a percentage of the correct value.
	(If you could not complete the calculation in part (4) of the <b>Analysis</b> section, you should assume that the student's value is 78.5. This is not the correct value.)
	Difference
	Percentage
3	Apart from loss of liquid during transfer to the gas syringe, identify <b>one</b> other source of error in this experiment. Suggest <b>one</b> improvement to minimise this other source of error.
	Source of error
	Improvement
4	Would a loss of liquid during transfer to the gas syringe result in a lower value for the $M_{\rm r}$ of liquid <b>X</b> ? Explain your answer.

**Exercise 3** The relative molecular mass,  $M_r$ , of a Group I metal carbonate

Skill assessed Planning (8 marks)

### Introduction

A Group I metal carbonate,  $M_2CO_3$ , (relative formula mass,  $M_r$ , between 100 and 150) reacts with hydrochloric acid as shown in the equation below.

$$M_2CO_3 + 2HC1 \longrightarrow 2MC1 + H_2O + CO_2$$

The  $M_r$  can be calculated by using the results from a titration in which standard hydrochloric acid is added from a burette to  $25.0 \,\mathrm{cm}^3$  portions of a solution of the carbonate. Methyl orange is a suitable indicator for this titration; it is red in acid and yellow in alkali.

You are provided with a solid sample of the Group I metal carbonate and a 0.100 mol dm<sup>-3</sup> solution of hydrochloric acid.

# Questions

Use the information above to answer the following questions in the space provided.

- 1 Suggest a suitable concentration for the Group I metal carbonate solution to be used. Explain your reasons for choosing this concentration.
- 2 State the volume of the standard solution of the metal carbonate you would prepare. Calculate the mass of the Group I metal carbonate you would need to weigh out to prepare this solution.
- 3 Describe in **detail** how you would prepare your standard solution. You do **not** need to describe the titration itself.
- 4 State how much indicator should be used and describe the colour change at the end-point.
- 5 Show how you would use the titration results to calculate the  $M_r$  of the Group I metal carbonate.
- 6 State **one** potential hazard and the relevant safety precautions you would take.
