General Certificate of Education January 2004 Advanced Level Examination

# CHEMISTRY CHM5 Unit 5 Thermodynamics and Further Inorganic Chemistry (including Synoptic Assessment)

Friday 23 January 2004 Afternoon Session

In addition to this paper you will require: a calculator.

Time allowed: 2 hours

### Instructions

- Use blue or black ink or ball-point pen.
- Fill in the boxes at the top of this page.
- Answer all questions in Section A and Section B in the spaces provided.
   All working must be shown.
- Do all rough work in this book. Cross through any work you do not want marked.
- The Periodic Table/Data Sheet is provided on pages 3 and 4. Detach this perforated sheet at the start of the examination.
- Section B questions are provided on a perforated sheet. Detach this sheet at the start of the examination.

### **Information**

- The maximum mark for this paper is 120.
- Mark allocations are shown in brackets.
- This paper carries 20 per cent of the total marks for Advanced Level.
- You are expected to use a calculator where appropriate.
- The following data may be required. Gas constant  $R = 8.31 \,\mathrm{J \, K^{-1} \, mol^{-1}}$
- Your answers to questions in **Section B** should be written in continuous prose, where appropriate. You will be assessed on your ability to use an appropriate form and style of writing, to organise relevant information clearly and coherently, and to use specialist vocabulary, where appropriate.

### Advice

• You are advised to spend about 1 hour on **Section A** and about 1 hour on **Section B**.

## SECTION A

Answer **all** questions in the spaces provided.

1 Chlorine is formed in a reversible reaction as shown by the equation

$$4HCl(g) + O_2(g) \implies 2Cl_2(g) + 2H_2O(g)$$

(a) Use the data below to calculate the standard enthalpy change,  $\Delta H^{\Theta}$ , and the standard entropy change,  $\Delta S^{\ominus}$ , for this reaction.

Substance	HCl(g)	O <sub>2</sub> (g)	Cl <sub>2</sub> (g)	H <sub>2</sub> O(g)
$\Delta H_{\rm f}^{\Theta}/{\rm kJmol}^{-1}$	-92	0	0	-242
$S^{\oplus}/\mathrm{J}\mathrm{K}^{-1}\mathrm{mol}^{-1}$	187	205	223	189

Standard enthalpy change, $\Delta H^{\Theta}$	
Standard entropy change, $\Delta S^{\Theta}$	
	(6 marks)

# The Periodic Table of the Elements

APW/0104/CHM5

■ The atomic numbers and approximate relative atomic masses shown in the table are for use in the examination unless stated otherwise in an individual question.

Group II element ${\bf A}$ burns when heated in chlorine forming the solid chlorid h melting point.	e <b>B</b> which has
n aqueous sodium hydroxide is added to an aqueous solution of ${\bf B}$ a white med.	precipitate C
pitate $\mathbb{C}$ does not dissolve when an excess of aqueous sodium hydroxide is aclve when aqueous sulphuric acid is added.	dded but does
State the type of bonding present in <b>B</b> .	
	(1 mark)
Identify <b>B</b> .	
	(1 mark)
Write an equation for the formation of chloride <b>B</b> from element <b>A</b> .	
	(1 mark)
Identify the precipitate <b>C</b> .	
	(1 mark)
Write an equation for the reaction in which ${\bf C}$ is formed.	
	(1 mark)
Write an equation for the reaction of <b>C</b> with aqueous sulphuric acid.	
	(1 mark)
	n aqueous sodium hydroxide is added to an aqueous solution of <b>B</b> a white med.  pitate <b>C</b> does not dissolve when an excess of aqueous sodium hydroxide is aclve when aqueous sulphuric acid is added.  State the type of bonding present in <b>B</b> .  Identify <b>B</b> .  Write an equation for the formation of chloride <b>B</b> from element <b>A</b> .  Identify the precipitate <b>C</b> .  Write an equation for the reaction in which <b>C</b> is formed.

TURN OVER FOR THE NEXT QUESTION

4 Use the data below, where appropriate, to answer the questions which follow.

Standard electrode potentials	<i>E</i> <sup>⇔</sup> /V
$2H^{+}(aq) + 2e^{-} \longrightarrow H_{2}(g)$	0.00
$Br_2(aq) + 2e^- \longrightarrow 2Br^-(aq)$	+1.09
$2BrO_3^-(aq) + 12H^+(aq) + 10e^- \longrightarrow Br_2(aq) + 6H_2O(l)$	+1.52

Each of the above can be reversed under suitable conditions.

(a)	State the hydrogen ion concentration and the hydrogen gas pressure when, at 298 K, the
	potential of the hydrogen electrode is 0.00 V.

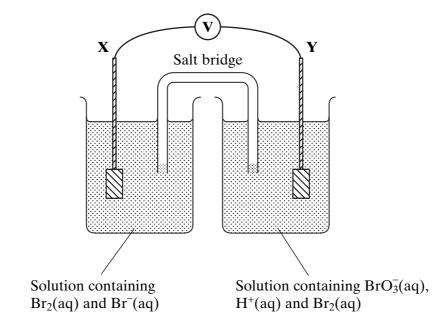

Hydrogen ion concentration	on	 
, 0		
Hydrogen gas pressure		 

The electrode potential of a hydrogen electrode changes when the hydrogen ion concentration is reduced. Explain, using Le Chatelier's principle, why this change occurs and state how the electrode potential of the hydrogen electrode changes.

Explanation of change	
Change in electrode potential	
Change in electrone potential	(3 marks

(2 marks)

(c) A diagram of a cell using platinum electrodes **X** and **Y** is shown below.

(i)	Use the data	above to	calculate	the	e.m.f.	of	the	above	cell	under	standard
	conditions.										

(ii)	Write a half	i-equa	tion	for the re	eaction	occurrii	ng at e	electrode	X	and	an	ove	erall
	equation fo	r the	cell	reaction	which	occurs	when	electrod	es	X	and	Y	are
	connected.												

Half-equation	
Overall equation	
	(4 marks)

TURN OVER FOR THE NEXT QUESTION

5	(a)	By reference to the forces between molecules, explain why ammonia is very water.	soluble in
			(2 marks)
	(b)	Aqueous solutions of ammonia have a pH greater than 7.	
		(i) Write an equation for the reaction of ammonia with water.	
		(ii) Explain why the pH of a solution containing 1.0 mol dm <sup>-3</sup> of ammonia is 14 at 298 K.	is less than
	(c)	An ammonium ion in aqueous solution can behave as a Brønsted–Lowry awhat is meant by the term $Brønsted$ –Lowry acid.	
			(1 mark)
	(d)	State what is meant by the term <i>buffer solution</i> . Identify a reagent which could to a solution of ammonia in order to form a buffer solution.	d be added
		Buffer solution	
		Reagent	(3 marks)

(e)	An acidic buffer solution is obtained when sodium ethanoate is dissolved in aqueous
	ethanoic acid.

(i)	Calculate the pH of the buffer solution formed at 298 K when 0.125 mol of sodium ethanoate is dissolved in 250 cm <sup>3</sup> of a 1.00 mol dm <sup>-3</sup> solution of ethanoic acid. The acid dissociation constant, $K_{\rm a}$ , for ethanoic acid is $1.70 \times 10^{-5}$ mol dm <sup>-3</sup> at 298 K.
(ii)	Write an ionic equation for the reaction which occurs when a small volume of dilute hydrochloric acid is added to this buffer solution.
	(5 marks)

TURN OVER FOR THE NEXT QUESTION

6

(a)	Expl	ain why complex ions with partially filled d sub-levels are usually coloured.
	•••••	
	•••••	(2 marks)
(b)	(i)	When aqueous ammonia was added to an aqueous solution of cobalt(II) sulphate, a blue precipitate $\mathbf{M}$ was formed. Identify the cobalt-containing species present in aqueous cobalt(II) sulphate and the precipitate $\mathbf{M}$ .
		Cobalt-containing species
		Precipitate M
	(ii)	Precipitate <b>M</b> dissolved when an excess of concentrated aqueous ammonia was added. The solution formed was pale brown due to the presence of the cobalt-containing species <b>P</b> . Identify <b>P</b> .
	(iii)	On standing in air, the colour of the solution containing $\mathbf{P}$ slowly darkened as the cobalt-containing species $\mathbf{Q}$ was formed. State the type of reaction occurring when $\mathbf{P}$ changes into $\mathbf{Q}$ and identify the reactant responsible for this change.
		Type of reaction
		Reactant responsible
	(iv)	When potassium iodide was added to the solution containing $\mathbf{Q}$ and the mixture was acidified, a dark red-brown colour due to the presence of $\mathbf{R}$ was produced. On addition of starch solution the mixture turned blue-black. Identify $\mathbf{R}$ and explain its formation.
		Identity of <b>R</b>
		Explanation
		(7 marks)

### **SECTION B**

Detach this perforated sheet.

Answer all of the questions below in the space provided on pages 15 to 20 of this booklet.

- When methane reacts with chlorine in sunlight, a mixture of chlorinated substitution products is obtained. Outline mechanisms for the formation of two of the chlorinated substitution products. (5 marks)
  - Two different organic products can be formed when 2-chloropropane, CH<sub>3</sub>CHClCH<sub>3</sub>, reacts with potassium hydroxide. The major product formed depends on the solvent in which the potassium hydroxide is dissolved.

Write equations showing the formation of these different products. In each case state the solvent which could be used to obtain the best yield of that product.

- State why the hydrogen ion concentration in aqueous iron(II) chloride is lower than that in aqueous iron(III) chloride of the same concentration.
- State what is observed when aqueous sodium hydroxide is added slowly, until present in excess, to aqueous chromium(III) chloride. Write equations for the reactions occurring. (4 marks)
- Vanadium(V) oxide is used as a heterogeneous catalyst in the Contact Process. (a)

Explain what is meant by the terms *heterogeneous* and *catalyst* and state, in general terms, how a catalyst works.

State the essential feature of vanadium chemistry which enables vanadium(V) oxide to function as a catalyst and, by means of equations, suggest how it might be involved in the Contact Process.

The following method was used to determine the percentage by mass of vanadium in a sample of ammonium vanadate(V).

A solution was made up by dissolving 0.160 g of ammonium vanadate(V) in dilute sulphuric acid. The ammonium vanadate(V) formed VO<sub>2</sub> ions in this solution. When an excess of zinc was added to this solution, the VO<sub>2</sub><sup>+</sup> ions were reduced to V<sup>2+</sup> ions and the zinc was oxidised to Zn<sup>2+</sup> ions.

After the unreacted zinc had been removed, the solution was titrated against a 0.0200 mol dm<sup>-3</sup> solution of potassium manganate(VII). In the titration, 38.5 cm<sup>3</sup> of potassium manganate(VII) solution were required to oxidise all vanadium(II) ions to vanadium(V) ions.

Using half-equations, construct an overall equation for the reduction of  $VO_2^+$  to  $V^{2+}$  by zinc in acidic solution.

Calculate the percentage by mass of vanadium in the sample of ammonium vanadate(V). (8 marks)

- The three compounds CH<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>OH, (CH<sub>3</sub>)<sub>3</sub>COH and CH<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>CHO can be distinguished by use of the following three reagents
  - 1. potassium dichromate(VI) acidified with dilute sulphuric acid
  - 2. Tollens' reagent
  - 3. ethanoic acid, together with a small amount of concentrated sulphuric acid.
  - Identify which of these three organic compounds would reduce acidified potassium dichromate(VI). Give the structures of the organic products formed. Write a half-equation for the reduction of dichromate(VI) ions in acidic solution. (6 marks)
  - (b) Identify which one of these three organic compounds would reduce Tollens' reagent. Give the structure of the organic product formed. Write a half-equation for the reduction of Tollens' reagent. (3 marks)
  - (c) Identify which of these three organic compounds would react with ethanoic acid in the presence of concentrated sulphuric acid. In each case, give the structure of the organic product formed. (4 marks)
  - (d) State the number of peaks in the proton n.m.r. spectra of CH<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>OH and of (CH<sub>3</sub>)<sub>3</sub>COH. (Analysis of peak splitting is not required.) (2 marks)
- **10** Metal reactivity and required purity are important considerations when choosing the method of extracting a metal. Each of the following is a reduction process used in the industrial extraction of one or more metals from its ore.

Method 1 high temperature reaction between an oxide and carbon

Method 2 electrolysis of a molten compound

Method 3 displacement from a compound using a more reactive metal

- (i) For each method of extraction, identify **one** metal which is extracted using this process and write an equation for the reaction in which the metal is formed.
- (ii) Give **two** reasons why Method 3 is a very expensive extraction process.
- When beryllium oxide is heated with carbon to a very high temperature, beryllium carbide, Be<sub>2</sub>C, is formed. This carbide reacts with water to form beryllium hydroxide and methane. Write an equation for the reaction of beryllium carbide with water. (10 marks)
- (b) Transition metals form complex ions. Using actual examples of complex ions formed by transition metal ions, give the formula of
  - a linear complex ion,
  - a tetrahedral complex ion and
  - an octahedral complex ion formed by using a bidentate ligand. (4 marks)

**END OF QUESTIONS**
