PHYSICS (SPECIFICATION A) PHA3/W
Unit 3 Current Electricity and Elastic Properties of Solids

Thursday 16 January 2003 Afternoon Session

In addition to this paper you will require:
- a calculator;
- a pencil and a ruler.

Time allowed: 1 hour 15 minutes

Instructions
- Use blue or black ink or ball-point pen.
- Fill in the boxes at the top of this page.
- Answer **all** questions in the spaces provided. All working must be shown.
- Do all rough work in this book. Cross through any work you do not want marked.

Information
- The maximum mark for this paper is 50.
- Mark allocations are shown in brackets.
- The paper carries 25% of the total marks for Physics Advanced Subsidiary and carries $12\frac{1}{2}$% of the total marks for Physics Advanced.
- A *Data Sheet* is provided on pages 3 and 4. You may wish to detach this perforated sheet at the start of the examination.
- You are expected to use a calculator where appropriate.
- In questions requiring description and explanation you will be assessed on your ability to use an appropriate form and style of writing, to organise relevant information clearly and coherently, and to use specialist vocabulary where appropriate. The degree of legibility of your handwriting and the level of accuracy of your spelling, punctuation and grammar will also be taken into account.

Data Sheet

- A perforated *Data Sheet* is provided as pages 3 and 4 of this question paper.
- This sheet may be useful for answering some of the questions in the examination.
- You may wish to detach this sheet before you begin work.

Answer **all** questions in the spaces provided.

1 A battery of emf 24 V and negligible internal resistance is connected to a resistor network as shown in the circuit diagram in **Figure 1**.

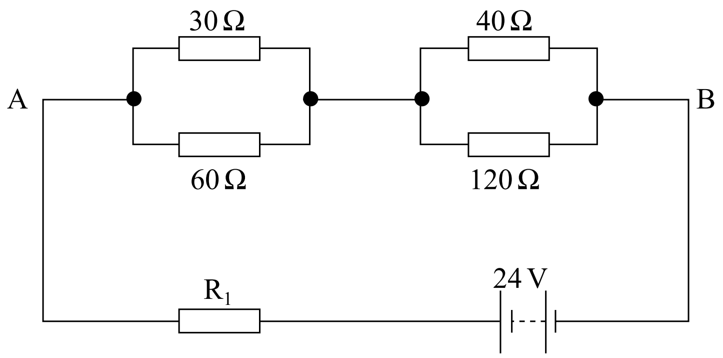

Figure 1

(a) Show that the resistance of the single equivalent resistor that could replace the four resistors between the points A and B is 50 Ω.

(4 marks)

(b) If R_1 is 50 Ω, calculate

(i) the current in R_1,

....

....

(ii) the current in the 60 Ω resistor.

....

(4 marks)

2 (a) In the circuit shown in **Figure 2**, the battery has an emf of 12 V and negligible internal resistance.

PQ is a potential divider, S being the position of the sliding contact. In the position shown, the resistance between P and S is 180 Ω and the resistance between S and Q is 60 Ω.

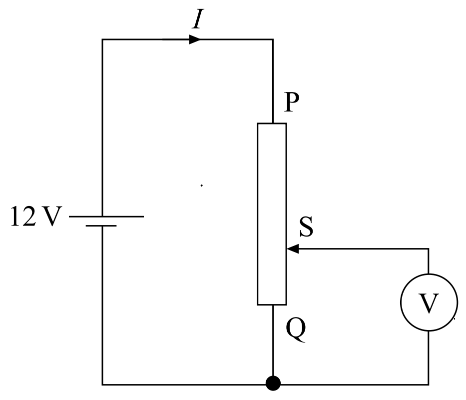

Figure 2

(i) Calculate the current, I, in the circuit, assuming that there is no current through the voltmeter V.

....

....

....

(ii) What property of the voltmeter allows us to assume that no current flows through it?

....

(iii) What is the reading on the voltmeter?

....

....

(4 marks)

(b) The circuit in **Figure 2** is modified as shown in **Figure 3**, by exchanging the voltmeter for a load R, whose resistance is about the same as the resistance of section SQ of the potential divider.

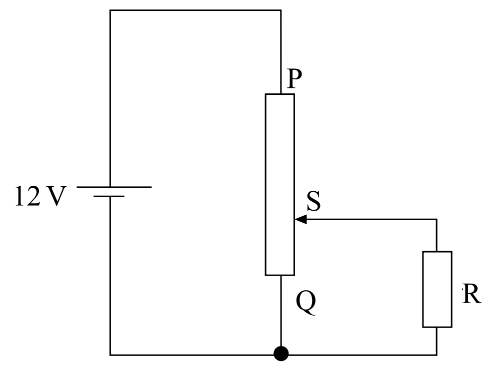

Figure 3

Explain, without calculation, why the current through the battery increases in value from that in part (a).

3 (a) The circuit shown in **Figure 4** may be used to determine the internal resistance of a battery. An oscilloscope is connected across the battery as shown. **Figure 5** represents the screen of the oscilloscope.

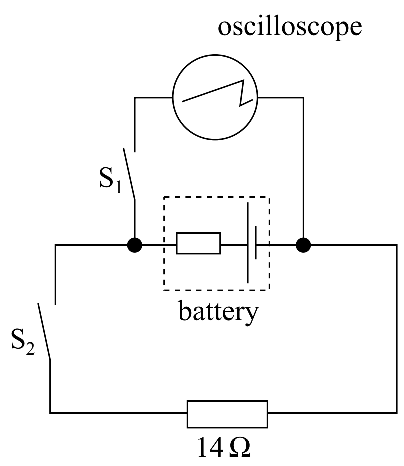

Figure 4

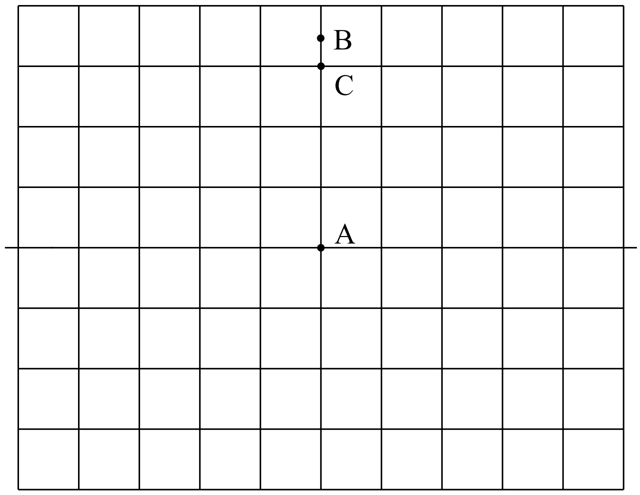

Figure 5

The time base of the oscilloscope is switched off throughout the experiment.
Initially the switches S_1 and S_2 are both open. Under these conditions the spot on the oscilloscope screen is at A.

(i) Switch S_1 is now closed, with S_2 remaining open. The spot moves to B.
State what the deflection AB represents.

....

(ii) Switch S_1 is kept closed and S_2 is also closed. The spot moves to C.
State what the deflection AC represents.

....

(iii) The vertical sensitivity of the oscilloscope is $0.50\,\text{V}\,\text{div}^{-1}$. Calculate the current through the 14 Ω resistor with both switches closed.

....

....

....

(iv) Hence, calculate the internal resistance of the battery.

....

(b) The oscilloscope is now connected to an alternating voltage source of rms value 3.5 V.

(i) Calculate the peak value of the alternating voltage.

....

....

(ii) Draw on **Figure 6** what you would expect to see on the oscilloscope screen, if the time base is still switched off and the voltage sensitivity is altered to 2.0 V div^{-1}.

6 A material in the form of a wire, 3.0 m long and cross-sectional area = $2.8 \times 10^{-7}\,m^2$ is suspended from a support so that it hangs vertically. Different masses may be suspended from its lower end. The table shows the extension of the wire when it is subjected to an increasing load and then a decreasing load.

load / N	0	24	52	70	82	88	94	101	71	50	16	0
extension / mm	0	2.2	4.6	6.4	7.4	8.2	9.6	13.0	10.2	8.0	4.8	3.2

(a) Plot, on the grid opposite, a graph of load (on y axis) against extension (on x axis) both for increasing and decreasing loads.

(4 marks)

(b) Explain what the shape of the graph tells us about the behaviour of the material in the wire.
