# Units 5 - 9 : Section A

1

(a)(i)

correct arrows: A ✓

B ✓  
C ✓

(a)(ii)  $e^{-1} + {}^A_ZX \rightarrow {}^A_{Z-1}Y + v_e$  ✓ (4)

(b)(i)  $((4.18 - 1.33) \times 10^{-13}) = 2.85 \times 10^{-13}$  (J) ✓

(b)(ii)  $1.33 \times 10^{-13}$  (J)  
 $0.30 \times 10^{-13}$  (J) for 3 correct values ✓  
 $1.63 \times 10^{-13}$  (J)

(b)(iii) (use of  $\Delta E = hf$  gives)  $f \left( = \frac{1.63 \times 10^{-13}}{6.63 \times 10^{-34}} \right) = 2.46 \times 10^{20}$  Hz ✓  
 (allow C.E. from (b)(ii) if largest value taken) (3)

(c)(i) (✓ for each precaution with reason to <sub>max</sub>2)

handle with (long) (30 cm) tweezers  
 because the radiation intensity decreases with distance

store in a lead box (immediately) when not in use  
 to avoid unnecessary exposure to radiation

[or any sensible precaution with reason]

(b)(ii)  $\gamma$  rays are more penetrating and are therefore more hazardous  
 (to the internal organs of the body)

$\beta^-$  particles are more hazardous because they are more ionising ✓  
 (✓ for any argued case for either radiation)

(3)  
(10)

## Unit 7 : Section B

2

(a) (use of  $v = \omega r$  gives  $\omega = \frac{3.5}{0.2} = 18 \text{ rad s}^{-1}$  ✓ (1)

(b)(i)  $\alpha = \frac{\omega_2 - \omega_1}{t} = (-) \frac{(17.5 + 17.5)}{4.6} = (-)7.6 \text{ rad s}^{-2}$  ✓

(b)(ii) (use of  $T = I\alpha$  gives)  $T = 40 \times 7.6 = 300 \text{ N m}$  ✓  
(allow C.E. for value of  $\alpha$  from (i))

(b)(iii) (use of *angular impulse* =  $Tt$  gives)  
angular impulse =  $300 \times 4.6 = 1.4 \times 10^3 \text{ kg m}^2 \text{ rad s}^{-1}$  ✓  
(allow C.E. for value of  $T$  from (ii))

(b)(iv) uniform torque therefore uniform acceleration,  $\therefore t = 2.3 \text{ s}$  ✓

$$\theta = \frac{(\omega_1 + \omega_2)}{2} t = \frac{17.5}{2} \times 2.3 = 20.13 \text{ (rad)} \quad \checkmark$$

number of turns =  $\frac{20.13}{2\pi} = 3.2$  (so 3 complete turns) ✓ (6)

(7)

3

(a)(i) torque =  $4 \times 0.60 \times 1.8 = 4.3(2) \text{ N m}$  ✓

(a)(ii)  $\omega = \frac{2\pi}{110} = 5.7(1) \times 10^{-2} \text{ (rad s}^{-1}\text{)}$  ✓

at steady speed, frictional torque = applied torque ✓

(use of  $P = T\omega$  gives)  $P = 4.32 \times 5.71 \times 10^{-2} = 0.25 \text{ W}$  ✓

(allow C.E. for value of  $T$  from (i)) (4)

(b)(i) average power =  $0.5 \times 0.25 = 0.125 \text{ (W)}$  ✓  
energy = average power  $\times$  time =  $0.125 \times 12$  ✓ (= 1.5 J)  
(allow C.E. for value of  $P$  from (a)(ii))

(b)(ii) (use of *kinetic energy* =  $\frac{1}{2}I\omega^2 = 1.5$  gives)

$$I = \frac{2 \times 1.5}{(5.71 \times 10^{-2})^2} = 910 \text{ kg m}^2 \quad \checkmark$$

(allow C.E. for value of  $\omega$  from (a)(ii)) (3)

(7)

4

- (a) (use of  $pV^\gamma = \text{constant}$  gives)  
 $1.01 \times 10^5 \times (4.25 \times 10^{-4})^{1.4} = 1.70 \times 10^5 \times V^{1.4}$  ✓  
 $V$  calculated correctly ( $= 2.93 \times 10^{-4}$ )  
or substitution to show equal  $pV^\gamma$  ✓ (2)

- (b)  $\frac{p_1 V_1}{T_1} = \frac{p_2 V_2}{T_2}$  ✓  
 $T_1 = 273 + 23 = 296$  (K) ✓  
 $T_2 = \frac{1.7 \times 10^5 \times 2.93 \times 10^{-4} \times 296}{1.01 \times 10^5 \times 4.25 \times 10^{-4}} = 343$  K (70 °C) ✓ (3)

- (c) slow compression is isothermal (temperature does not increase) ✓  
greater change in volume needed to rise to same final pressure ✓  
(or correct  $pV$  sketches showing adiabatic and isothermal processes)  
hence less ✓✓ (3)  
(8)

5

- (a) work per cycle = area enclosed =  $6 \times 10^5 \times 4.5 \times 10^{-3} = 2.7$  (kJ) ✓  
power = work output per sec =  $\frac{2700}{0.20} = 13.5$  kW ✓  
(allow C.E. for incorrect work per cycle) (2)

- (b) modified engine uses less steam per cycle ✓  
so lower energy input per cycle ✓  
input energy per cycle  $\approx \frac{1}{3}$  of that in unmodified cycle ✓  
work output per cycle is less than for unmodified cycle ✓  
work output per cycle  $> \frac{1}{2}$  of that in unmodified cycle ✓  
hence greater efficiency ✓ max(4)  
(6)

Quality of Written Communication (Q1(c)(i) and Q5(b)) (2)  
(2)
