Advanced Level Examination

PHYSICS (SPECIFICATION A) PHAP
Units 5-9 Practical

Monday 2 February 2004 Morning Session

In addition to this paper you will require:
- a calculator;
- a pencil and a ruler.

Time allowed: 1 hour 45 minutes

Instructions
- Use blue or black ink or ball-point pen.
- Fill in the boxes at the top of this page.
- Answer **both** questions in the spaces provided. All working must be shown.
- Do all rough work in this book. Cross through any work you do not want marked.

Information
- The maximum mark for this paper is 30.
- Mark allocations are shown in brackets.
- The paper carries 15% of the total marks for Physics Advanced.
- A **Data Sheet** is provided on pages 3 and 4. You may wish to detach this perforated sheet at the start of the examination.
- You are expected to use a calculator where appropriate.
- You are advised to spend no more than 30 minutes on Question 1.

Data Sheet

- A perforated *Data Sheet* is provided as pages 3 and 4 of this question paper.
- This sheet may be useful for answering some of the questions in the examination.
- You may wish to detach this sheet before you begin work.

Answer **both** questions.

You are advised to spend no more than 30 minutes on Question 1.

1 Students are shown a demonstration illustrating some principles of electromagnetic induction.

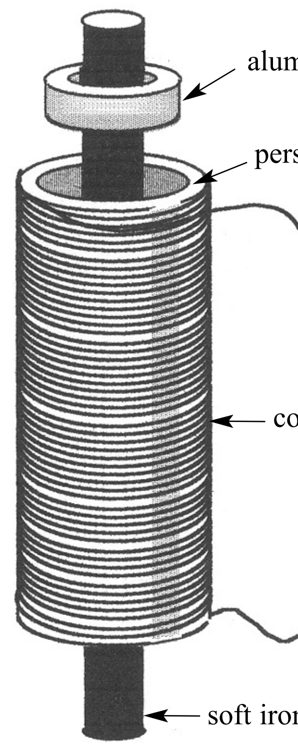
A coil is wrapped around the full length of a vertical perspex tube through which a soft iron rod is inserted.

An aluminium ring is placed over the upper end of the rod.

When released from rest, the ring falls freely down the gap between the rod and the perspex tube.

The time taken for the aluminium ring to fall from the top to the bottom of the perspex tube is noted.

When an alternating current is passed through the coil, the time taken for the aluminium ring to fall from the top to the bottom of the perspex tube is seen to increase slightly.



Design an experiment to investigate how some variable factor or measurable detail of the experimental arrangement affects the time for the aluminium ring to fall from the top to the bottom of the perspex tube.

You should assume that the normal laboratory apparatus used in schools and colleges is available. You may wish to draw a diagram to illustrate your answer.

You should also include the following in your answer:

- The quantities you intend to measure and how you will measure them.
- How you propose to use your measurements to obtain reliable results for the investigation.
- Any factors you will need to control and how you will do this.
- How you could overcome any difficulties in obtaining reliable results.

Write your answers to Question 1 on **pages 6 and 7** of this booklet. *(8 marks)*

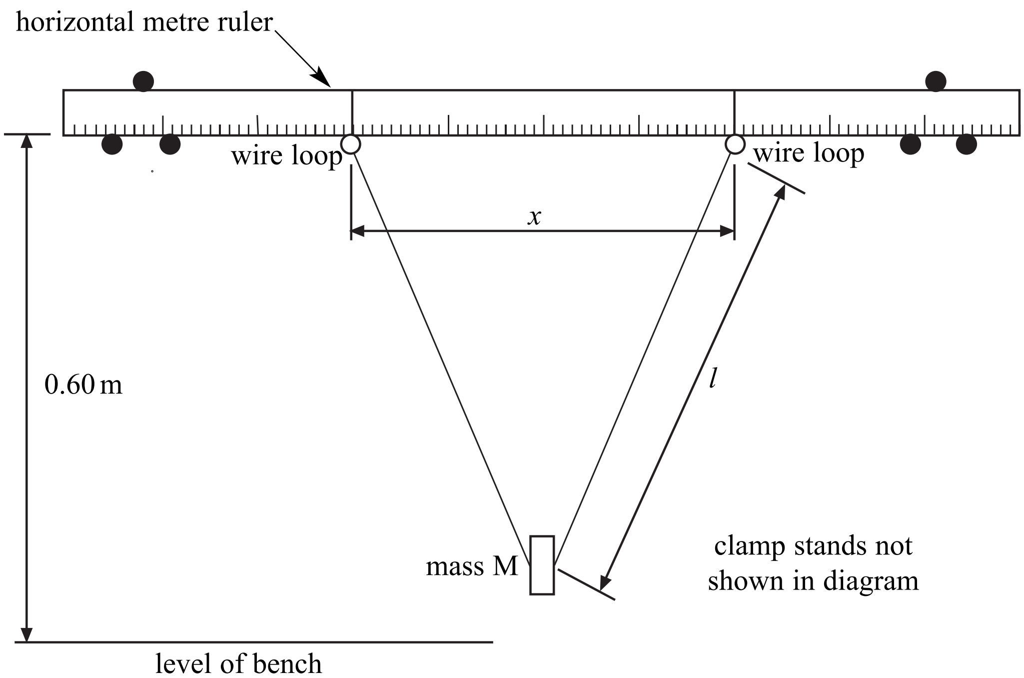
2 You are required to measure the time period of a V-shaped pendulum.
No description of the experiment is required.

(a) You are provided with a metre ruler fitted with two wire loops. Clamp each end of this ruler 0.60 m above the bench so that the ruler is horizontal with the graduated face of the ruler towards you.

A length of thread has been attached to one of the loops. Pass the free end of the thread through the hole in the mass M and then through the other wire loop.
Check that the total length of thread joining the two wire loops lies between 1.00 m and 1.20 m.
Secure the free end of the thread to the wire loop to form a V-shaped pendulum, as shown in the diagram.
Once you have constructed the pendulum, do not subsequently change the length of the thread joining the two wire loops.



Adjust the position of the wire loops until the distance, x, marked in the diagram, is 0.40 m.
Adjust the position of the mass until the length, l, of each part of the thread is the same.

Measure and record l.

l = ... *(1 mark)*

(b) Displace and then release the mass so that it performs small amplitude oscillations in a plane perpendicular to that defined by the equilibrium position of the threads. Make and record suitable measurements to find the period, *T*, of these oscillations.

Repeat this procedure for **four larger** values of x.
Record your observations below.
