General Certificate of Education Advanced Level Examination January 2012

**Statistics** 

**SS04** 

**Unit Statistics 4** 

Wednesday 25 January 2012 1.30 pm to 3.00 pm

# For this paper you must have:

• the blue AQA booklet of formulae and statistical tables. You may use a graphics calculator.

#### Time allowed

• 1 hour 30 minutes

## Instructions

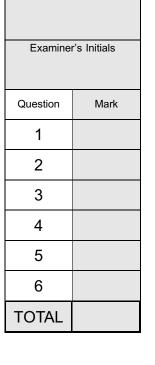

- Use black ink or black ball-point pen. Pencil should only be used for drawing.
- Fill in the boxes at the top of this page.
- Answer all questions.
- Write the question part reference (eg (a), (b)(i) etc) in the left-hand margin.
- You must answer the questions in the spaces provided. Do not write outside the box around each page.
- Show all necessary working; otherwise marks for method may be lost
- Do all rough work in this book. Cross through any work that you do not want to be marked.
- The **final** answer to questions requiring the use of tables or calculators should normally be given to three significant figures.

### Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 75.

#### **Advice**

- Unless stated otherwise, you may quote formulae, without proof, from the booklet.
- You do not necessarily need to use all the space provided.

For Examiner's Use

Answer all questions in	the spaces provided.

A gas company claimed that the length of time between a gas leak being reported and an engineer arriving to investigate the report has a mean of 115 minutes. A random sample of these times, in minutes, was

141 85 152 114 150 103 66 234

Using the 5% significance level, test whether there is evidence that the mean time exceeds 115 minutes. Assume that the distribution of times is normal. (9 marks)

- Gemima commutes to work by bicycle. Provided that her tyres are in good condition, the probability of a puncture on her journey between home and work is 0.0025. This probability is independent for each journey. During the last 2 months of 2011, she made 80 journeys between home and work.
  - (i) Using a distributional approximation, find the probability that, when Gemima makes 80 journeys between home and work with her tyres in good condition, there will be a puncture on 2 or more journeys. (4 marks)
  - (ii) In fact, there was a puncture on 2 journeys when Gemima cycled between home and work during the last 2 months of 2011. Comment on the suggestion that she should buy new tyres.

    (2 marks)
  - (b) Simon uses his bicycle every day. When his bicycle chain is worn out, the probability that it will come off during a day's cycling is, independently, 0.32.
    - (i) Using a distributional approximation, find the probability that, when Simon's chain is worn out, it will come off on 10 or fewer days out of 60. (6 marks)
    - (ii) In fact, Simon's chain came off on 3 days during the last 60 days of 2011. Comment on the suggestion that he should buy a new chain. (2 marks)

3	A company which sells tools claims that more than 40 per cent of people admit to having used kitchen cutlery, instead of the appropriate tools, when attempting a 'do it yourself' (DIY) job.	
	Students at a university were asked to complete a confidential questionnaire when applying for accommodation. The first question was:	
	Have you ever attempted a DIY job? Yes/No	
	Those who answered 'Yes' were then asked the next question:	
	Have you ever used kitchen cutlery instead of the appropriate tools when attempting a DIY job? Yes/No	
(a)	Of the 98 students who answered the first question, 48 answered 'No'.	
	Calculate an approximate 95% confidence interval for the proportion of students applying for accommodation who claim not to have attempted a DIY job. Assume that students answering the question may be regarded as a random sample. (5 mark)	cs)
(b)	Of the 50 students who answered 'Yes' to the first question, 25 answered 'Yes' to the next question.	
	Test whether there is evidence, significant at the 5% level, to support the claim that more than 40 per cent of students applying for accommodation who have attempted DIY jobs admit to having used kitchen cutlery instead of the appropriate tools. Use an exact distribution and assume that the sample is random. (6 marks	·
(c)	Summarise your results in the context of the company's claim. (3 mark	ts)

4		A travel company operates a service transporting passengers from a harbour of Danish island to Copenhagen, which is situated on the mainland. A boat take passengers from the island to the mainland, where a bus is provided which taken to Copenhagen.	es the
		The duration of the boat journey is normally distributed with mean 74 minute standard deviation 4.6 minutes.	es and
		The time to transfer passengers and luggage from the boat to the bus is norm distributed with mean 28 minutes and standard deviation 5.3 minutes.	ally
		The duration of the bus journey is normally distributed with mean 126 minute standard deviation 7.2 minutes.	es and
(a	) (i)	Find the distribution of the total journey time from the island to Copenhagen. Assume that the three times which contribute to the total journey time are independent.	
	(ii)	Find the probability that the total journey time will be more than 4 hours. (	(6 marks)
(b	)	Bergitte uses the service every Saturday. She leaves her home on the island at 9.45 am to travel to the harbour to catch the boat which leaves at 10.00 and time taken by the taxi to drive from Bergitte's home to the harbour is normal distributed with mean 11 minutes and standard deviation 2.9 minutes.	n. The
	(i)	Find the probability that Bergitte reaches the harbour before 10.00 am.	(2 marks)
	(ii)	If Bergitte does not reach the harbour before 10.00 am, she must wait for the service to Copenhagen, which leaves at 2.00 pm.	next
		Find the mean length of time that it takes Bergitte from leaving home to reac Copenhagen.	hing
		You may assume that the journey time from the harbour to Copenhagen is the of the distribution considered in part (a).	e mean (3 marks)
	(iii)	What advice would you give to Bergitte?	(1 mark)

6	Jiang decided to sell his house and asked Lorraine, an estate agent, to advertise the house for sale. Lorraine claimed that her advertising would lead to an average of at least 2 prospective buyers per week viewing the house until it was sold.				
	During the 15 weeks that Lorraine advertised the house for sale, a total of 24 prospective buyers viewed it.				
(a)	Assuming that the number of prospective buyers viewing the house may be modelled by a Poisson distribution, examine, using a distributional approximation, whether there is evidence that the mean was less than 2 per week. Use the 10% significance level.  (8 marks)				
(b)	After these 15 weeks, the house had not been sold. Jiang was dissatisfied with the number of prospective buyers viewing the house and transferred to Imran's estate agency. He told Imran that he had a mean of 1.6 prospective buyers per week viewing the house when Lorraine was advertising it. Imran promised to increase this mean number.				
	The numbers of prospective buyers viewing the house during Imran's first five weeks of advertising it for sale were				
	3 1 2 0 4				
	Using an exact Poisson distribution, test whether there is evidence, at the 5% significance level, to show that the mean number of prospective buyers per week viewing the house was greater than 1.6 when Imran was advertising it.				

(c) Based on your conclusions from parts (a) and (b), was Jiang wise to change estate agents? Justify your answer. (2 marks)
