MARK SCHEME for the October/November 2011 question paper

for the guidance of teachers

9700 BIOLOGY

9700/21

Paper 2 (AS Structured Questions), maximum raw mark 60

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes must be read in conjunction with the question papers and the report on the examination.

• Cambridge will not enter into discussions or correspondence in connection with these mark schemes.

Cambridge is publishing the mark schemes for the October/November 2011 question papers for most IGCSE, GCE Advanced Level and Advanced Subsidiary Level syllabuses and some Ordinary Level syllabuses.

Page 2	Mark Scheme: Teachers' version	Syllabus	Paper
	GCE AS/A LEVEL – October/November 2011	9700	21

Mark scheme abbreviations:

;	separates marking points
1	alternative answers for the same point
R	reject
Α	accept (for answers correctly cued by the question, or by extra guidance)
AW	alternative wording (where responses vary more than usual)
<u>underline</u>	actual word given must be used by candidate (grammatical variants excepted)
max	indicates the maximum number of marks that can be given
ora	or reverse argument
mp	marking point (with relevant number)
ecf	error carried forward
I	ignore

	Page 3			Mark Scheme: Teachers' version	Syllabus	Paper	
				GCE AS/A LEVEL – October/November 2011	9700	21	
1	(a)	P Q allow	to pr to ch v 1 n	otein on right hand side (closed carrier protein) ; aannel protein on left (open carrier protein) ; aark if P and Q wrong way round			
		 R to, central / left, sugar chain on glycoprotein ; S to circles of phospholipids on the lower surface ; T to cholesterol ; accept names instead of labels accept if letters put on the appropriate structures without using label lines, letter must be within each structure 					
	(b)	attac ref. a	chme abilit <u>y</u>	ent (of bacteria) to receptor(s); AW y to attach to antibody (bound to antigen on bacterium)		
		<pre>infolding / invagination / AW, of membrane ; A membrane engulfs A pseudopodia form (round bacterium) fusion / AW, of membrane ; formation of, vacuole / vesicle ;</pre>					
						FT (1 01	
						[lotal: 8]	
2	(a)	(i)	tang 0.27	ent drawn on the graph as close as possible to time 0 ;	e.g. 1.6 / 6 ;		
			acce <u>corre</u> state or tang corre	ept ect volume of gas e.g. 2.5 4.2 ed time, up to and including 20 secs 10 20 ent drawn on the graph before 20 secs 5.8 20 ect calculation ; e.g. 0.25 (cm ³ s ⁻¹), 0.22 (cm ³ s ⁻¹) A e.g. 0.29 rd one mark if the time is 21–40 s but the calculation is	$\left. \begin{array}{c} \frac{3}{0} \\ \\ \\ \end{array} \right\};$ $\mathbf{A} \ 0.215$ is completed corr	ectly [2]	
		(ii)	acce initia (rate no fu corre	ept hydrogen peroxide or reactant for substrate Ily high concentration of substrate so, rate of reaction a maximum / AW ; slows as) concentration of substrate decreases ; A s urther change in volume / AW, reaction has stopped ; ect data quote <u>to support explanation(s)</u> ;	high / enzyme a ubstrate being u	activity at used up	
		correct ref. to number of (successful) collisions; correct ref. to enzyme-substrate complexes / active sites occupied; [max 3]					

Page 4	Mark Scheme: Teachers' version	Syllabus	Paper
	GCE AS/A LEVEL – October/November 2011	9700	21

- (b) 1 (copper ions act as enzyme) inhibitor ; **R** competitive inhibitor
 - **2** non-competitive (inhibition);
 - 3 (non-competitive) inhibitor / Cu²⁺, combines with enzyme at site other than active site;
 - 4 active site shape / tertiary structure / 3D shape, changes ;
 - 5 active site no longer accepts substrate / enzyme-substrate complex not formed / AW;
 - 6 independent of substrate concentration / increase in substrate concentration has no effect / AW;
 - 7 comparative rates quoted from Fig. 2.2 ; e.g. max, $3.25 \text{ cm}^3 \text{ s}^{-1} \text{ v} 0.22-0.25 \text{ cm}^3 \text{ s}^{-1}$
 - 8 AVP ; e.g. actual rate depends on the relative concentration of inhibitor / AW
 V_{max} not reached
 - effect of ion presence on tertiary structure

[max 4]

- (c) enzymes are proteins;
 - ref. transcription ; accept description
 - ref. to mRNA ;
 - ref. translation ; accept description

ref. to further folding / glycosylation / modifying, in, RER / Golgi body ; [max 3]

in correct context

[Total: 12]

 GCE AS/A LEVEL – October/November 2011 9700 21 (a) primary sequence / arrangement / order / AW, of amino acids ; secondary a, helix / helices ; A description ignore any ref to β / pleated, sheet tertiary folding of, one / each, polypeptide / globin ; A coiling (shape) held in place by interactions between, R-groups / side chains ; A three or more named interactions quaternary (arrangement / interaction, of) four polypeptides / four globins / two α and two β globins ; A chains A ref. to more than one polypeptide if specific ref. to α and β chains haem / prosthetic group ; A porphyrin [ma (b) six / first five and seventh, amino acids are the same ; ora amino acid at position 6 is different both are 1. val-2.his-3.leu-4.thr-5.pro7.glu ; take from diagram variant 1 is, glutamic acid / glu (whereas), variant 2 is, valine / val ; (c) (i) withstands pressure ; prevents, overstretching / AW ; prevents, overstretching / AW ; prevents, overstretching / AW ; prevents, bursting / rupture / AW ; 1 polypeptides are not identical (v. 2 identical, α / β, polypeptides) ; 2 triple helix or three, polypeptides / helices (v. 4 polypeptides) ; 3 only composed of amino acids or no, prosthetic group / haem / iron ; 4 (fibrous so) not globular ; 5 no complex folding / AW (v. complex folding) ; A no tertiary structure 6 glycine is repeated every 3rd position / more glycine ; 7 repeating triplets of amino acids / large number repeating amino acid sequences (v. greater variety) ; 8 AVP ; e.g. different primary structure / AW variation in amino acid sequences (v specific sequences) all polypeptides, helical / AW (v. c offiferent to β, polypeptides) hydrogen bonds between polypeptides (v. Van der Waals) covalent bonds between polypeptides (v. Tom fibrils) (v. none) 300nm long polypeptides (v 5–10nm) 	Page 5		Mark Scheme: Teachers' version	Syllabus	Paper		
 (a) primary sequence / arrangement / order / AW, of amino acids ; secondary a, helix / helices ; A description ignore any ref to β / pleated, sheet tertiary folding of, one / each, polypeptide / globin ; A coiling (shape) held in place by interactions between R-groups / side chains ; A three or more named interactions quaternary (arrangement / interaction, of) four polypeptides / four globins / two α and two β globins; A chains A ref. to more than one polypeptide if specific ref. to α and β chains haem / prosthetic group ; A porphyrin [ma (b) six / first five and seventh, amino acids are the same ; ora amino acid at position 6 is different both are 1. val-2.his-3.leu-4.thr-5.pro7.glu ; take from diagram variant 1 is, glutamic acid / glu (whereas), variant 2 is, valine / val ; (c) (i) withstands pressure ; prevents, overstretching / AW ; prevents, bursting / rupture / AW ; [ma (ii) assume answer is about collagen unless told otherwise 1 polypeptides are not identical (v. 2 identical, α / β, polypeptides) ; 2 triple helix or three, polypeptides / helices (v. 4 polypeptides) ; 3 only composed of amino acids or no, prosthetic group / haem / iron ; 4 (fibrous so) not globular ; 5 no complex folding / AW (v. complex folding) ; A no tertiary structure 6 glycine is repeated every 3rd position / more glycine ; 7 repeating triplets of amino acids / large number repeating amino acid sequences (v. greater variety) ; 8 AVP ; e.g. different primary structure / AW variation in amino acid sequences (v specific sequences) all polypeptides, helical / AW (v. c a different to β, polypeptides) hydrogen bonds between molecules (to for hire) hydrogen bonds between polypeptides (v. Van der Waals) covalent bonds between polypeptides (v. Van der Waals) covalent bonds between molecules (to com filer) (v. none) 300nm long polypeptides (v. 5–10nm) 			GCE AS/A LEVEL – October/November 2011	9700 21			
 secondary a, helix / helices; A description ignore any ref to β / pleated, sheet tertiary folding of, one / each, polypeptide / globin; A coiling (shape) held in place by interactions between, R-groups / side chains; A three or more named interactions quaternary (arrangement / interaction, of) four polypeptides / four globins / two a and two β globins; A chains A ref. to more than one polypeptide if specific ref. to a and β chains haem / prosthetic group; A porphyrin (ma (b) six / first five and seventh, amino acids are the same; ora amino acid at position 6 is different both are 1. val-2.his-3.leu-4.thr-5.pro7.glu; take from diagram variant 1 is, glutamic acid / glu (whereas), variant 2 is, valine / val; (c) (i) withstands pressure; prevents, overstretching / AW; prevents, bursting / rupture / AW; (ma (ii) assume answer is about collagen unless told otherwise polypeptides are not identical (v. 2 identical, α / β, polypeptides); triple helix or three, polypeptides / helices (v. 4 polypeptides); only composed of amino acids or no, prosthetic group / haem / iron; (fibrous so) not globular; no complex folding / AW (v. complex folding); A no tertiary structure glycine is repeated every 3rd position / more glycine; repeating triplets of amino acids / large number repeating amino acid sequences (v. greater variety); AVP; e.g. different primary structure / AW variation in amino acids sequences (v. Specific sequences) all polypeptides, helical / AW (v. a different to β, polypeptides) hydrogen bonds between nolecules (to form fibrils) (v. none) 300nm long polypeptides (v.5–10nm) 	(a)	<i>prima</i> seque	γ nce / arrangement / order / AW, of amino acids ;				
 <i>tertiary</i> folding of, one / each, polypeptide / globin ; A coiling (shape) held in place by interactions between, R-groups / side chains ; A three or more named interactions <i>quaternary</i> (arrangement / interaction, of) four polypeptides / four globins / two α and two β globins ; A chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptide if specific ref. to α and β chains A ref. to more than one polypeptides / summary variant 1 is, glutamic acid / glu (whereas), variant 2 is, valine / val; (c) (i) withstands pressure ; prevents, overstretching / AW ; prevents, bursting / rupture / AW ; for ourposed of amino acids or no, prosthetic group / haem / iron ; f (fibrous so) not globular ; no complex folding / AW (v. complex folding); A no tertiary structure g glycine is repeated every 3rd po		<i>secon</i> α, heli	dary x / helices ; A description <i>ignore any ref to</i> β / pleated	d, sheet			
 quaternary (arrangement / interaction, of) four polypeptides / four globins / two α and two β globins; A chains A ref. to more than one polypeptide if specific ref. to α and β chains haem / prosthetic group; A porphyrin [ma (b) six / first five and seventh, amino acids are the same; ora amino acid at position 6 is different both are 1. val-2.his-3.leu-4.thr-5.pro7.glu; <i>take from diagram</i> variant 1 is, glutamic acid / glu (whereas), variant 2 is, valine / val; (c) (i) withstands pressure; prevents, overstretching / AW; prevents, overstretching / AW; prevents, overstretching / AW; (ii) assume answer is about collagen unless told otherwise 1 polypeptides are not identical (v. 2 identical, α / β, polypeptides); 2 triple helix or three, polypeptides / helices (v. 4 polypeptides); 3 only composed of amino acids or no, prosthetic group / haem / iron; 4 (fibrous so) not globular; 5 no complex folding / AW (v. complex folding); A no tertiary structure 6 glycine is repeated every 3rd position / more glycine; 7 repeating triplets of amino acids / large number repeating amino acid sequences (v. greater variety); 8 AVP; e.g. different primary structure / AW variation in amino acid sequences (v. Specific sequences) all polypeptides, helical / AW (v. different to β, polypeptides) hydrogen bonds between polypeptides (v. Van der Waals) covalent bonds between polypeptides (v. Van der Waals) covalent bonds between polypeptides (v. Van der Waals) covalent bonds between polypeptides (v. Form fibrils) (v. none) 300nm long polypeptides (v. 5–10nm) 		tertiar folding (shap A	y of, one / each, polypeptide / globin; A coiling e) held in place by interactions between, R-groups / side three or more named interactions	chains;			
 haem / prosthetic group; A porphyrin [ma (b) six / first five and seventh, amino acids are the same; ora amino acid at position 6 is different both are 1. val-2.his-3.leu-4.thr-5.pro7.glu; <i>take from diagram</i> variant 1 is, glutamic acid / glu (whereas), variant 2 is, valine / val; (c) (i) withstands pressure; prevents, overstretching / AW; prevents, overstretching / AW; [ma (ii) assume answer is about collagen unless told otherwise 1 polypeptides are not identical (v. 2 identical, α / β, polypeptides); 2 triple helix or three, polypeptides / helices (v. 4 polypeptides); 3 only composed of amino acids or no, prosthetic group / haem / iron; 4 (fibrous so) not globular; 5 no complex folding / AW (v. complex folding); A no tertiary structure 6 glycine is repeated every 3rd position / more glycine; 7 repeating triplets of amino acids / large number repeating amino acid sequences (v. greater variety); 8 AVP; e.g. different primary structure / AW variation in amino acid sequences (v. specific sequences) all polypeptides, helical / AW (v. a different to β, polypeptides) hydrogen bonds between molecules (to form fibrils) (v. none) 300nm long polypeptides (v. 5–10nm) 		<i>quate</i> (arran g	<i>mary</i> gement / interaction, of) four polypeptides / four glo obins ; A chains A ref. to more than one polypeptide	bins / two α ar if specific ref. tc	nd two β α and β
