BIOLOGY 9700/36

Advanced Practical Skills 2

October/November 2013

2 hours

Candidates answer on the Question Paper.

Additional Materials: As listed in the Confidential Instructions.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black ink.

You may use a pencil for any diagrams, graphs or rough working.

Do **not** use red ink, staples, paper clips, highlighters, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

For Exam	iner's Use
1	
2	
Total	

This document consists of 11 printed pages and 1 blank page.

You are reminded that you have **only one hour** for each question in the practical examination.

For Examiner's Use

You should:

- read carefully through the whole of question 1 and question 2
- then plan your use of the time to make sure that you finish all the work that you would like to do.

You will **gain marks** for recording your results according to the instructions.

1 The enzyme amylase catalyses the hydrolysis (breakdown) of starch to a reducing sugar.

You are required to:

- identify which solution, **E1** or **E2** contains the highest enzyme concentration by estimating the concentration of reducing sugar produced by the action of **E1** and **E2** when breaking down starch
- prepare known concentrations of reducing sugar solutions to compare with the concentrations of reducing sugars produced by the action of **E1** and **E2**
- compare the concentrations of reducing sugars by using the Benedict's test.

For each of your Benedict's tests you need to standardise the:

- volume of Benedict's solution
- volume of the samples
- temperature of the water bath.
- (a) (i) State the:

volume of Benedict's solution	cm ³	
volume of each of the samples to be tested	cm ³	
temperature of water bath	. °C.	

You are provided with:

labelled	contents	hazard	volume / cm ³
E1	amylase solution	harmful irritant	20
E2	amylase solution	harmful irritant	20
S	starch solution	none	50
G	0.4% reducing sugar solution	none	50
W	distilled water	none	100

[1]

Read steps 1 to 6 before proceeding.

Proceed as follows:

- Put 1 cm³ of **E1** and **E2** into separate beakers.
- 2. Put 10 cm³ of **S** into each of the beakers with **E1** and **E2**. Mix well.
- 3. Leave the beakers for 15 minutes.

During the 15 minutes you are required to:

- set up a water bath ready for step 6 (on page 4)
- prepare the known concentrations of the reducing sugar solution.
- 4. Set up the water bath to heat to the temperature as decided in (a)(i).
 - (ii) Decide which concentrations of the reducing sugar solution to make:
 - using serial dilution
 - using 20 cm³ of the 0.4% reducing sugar solution, **G**, to start the **serial dilution**
 - reducing the concentration by **half** between each concentration.

Complete Fig. 1.1 to show how you will make three further concentrations.

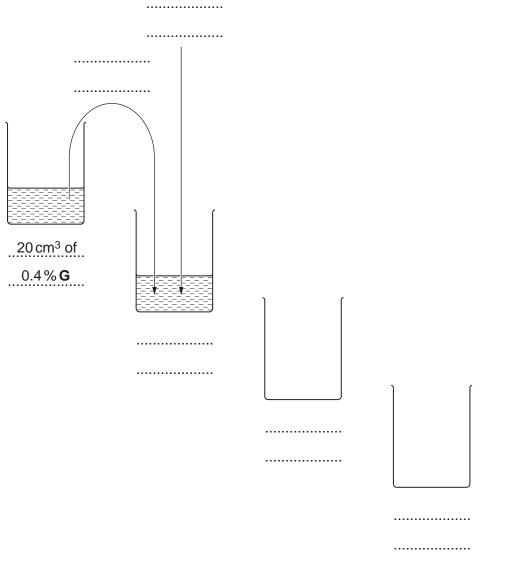

Fig. 1.1 [3]

For Examiner's Use 5. Prepare all the concentrations of the reducing sugar solution, as in Fig. 1.1, in the containers provided.

For Examiner's Use

- 6. You are now required to test for the concentrations of reducing sugars by using the Benedict's test:
 - test each sample separately using the volumes decided in (a)(i)
 - record the time taken for the appearance of any colour change.
 If there is no colour change after 120 seconds record 'more than 120'.
 - (iii) Prepare the space below and record **only** your results for the known concentrations of reducing sugars.

[5]

(iv)	Using your results for E1 and E2 complete the following.
	The time taken for the first colour change in E1 was
	The time taken for the first colour change in E2 was
	Using these two times, state which of these two solutions has the highest concentration of reducing sugars.
	Using the results from (a)(iii) estimate the concentration of reducing sugars in this solution.
	[2]
(v)	Describe how you would modify this investigation to follow the time course of the hydrolysis of starch by enzyme E , without the use of Benedict's solution.

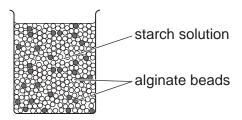

For Examiner's Use **(b)** A student investigated the effect of iron sulfate on the rate of amylase activity, using immobilised amylase in alginate beads.

For Examiner's Use

The student prepared two types of alginate beads containing amylase:

- with iron sulfate
- without iron sulfate.

The student mixed the two types of beads together in varying proportions, for example 30 beads with iron sulfate and 70 beads without iron sulfate (30% with iron sulfate) as shown in Fig. 1.2. The student put the beads into beakers containing starch solution.

Key:

- alginate beads with iron sulfate
- o alginate beads without iron sulfate

Fig. 1.2

Other variables were considered and kept to a standard.

The student measured the mass of reducing sugars produced by each mixture of beads in one minute.

The student's results are shown in Table 1.1.

Table 1.1

percentage of beads with iron sulfate	mass of reducing sugar produced / μmoles min ⁻¹
0	60
10	25
20	12
30	5
40	2

(i) Plot a graph of the data shown in Table 1.1.

 2 The eyepiece graticule scale in your microscope may be used to help draw a plan diagram, as in (a), with the correct shape and proportions of the tissue, without needing to calibrate the eyepiece graticule scale.

For Examiner's Use

N1 is a slide of a stained transverse section through a tubular organ from an animal.

(a) Select a part of the wall of the organ which shows the highest number of different layers of tissues.

Draw a large plan diagram of a part of the wall of the organ to show the proportions of the different layers of tissues.

On your diagram, use a label line and label to show the lumen.

[5]

Fig. 2.1 is a photomicrograph of cells from the same tubular organ as the specimen on slide N1.

For Examiner's Use

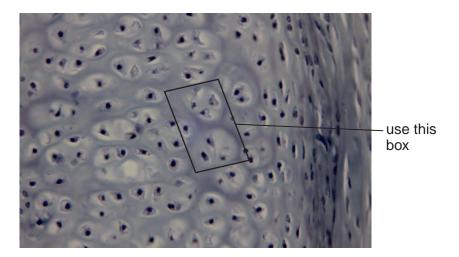

Fig. 2.1

(b) Make a large drawing of the whole cells shown in the box marked on Fig. 2.1. The drawings should show any difference in size (linear magnification) observed between each cell.

On your drawing, use a label line and label to show one nucleus.

www.theallpapers.com

Fig. 2.2 is a photomicrograph of a stained transverse section through a different tubular organ of an animal.

For Examiner's Use

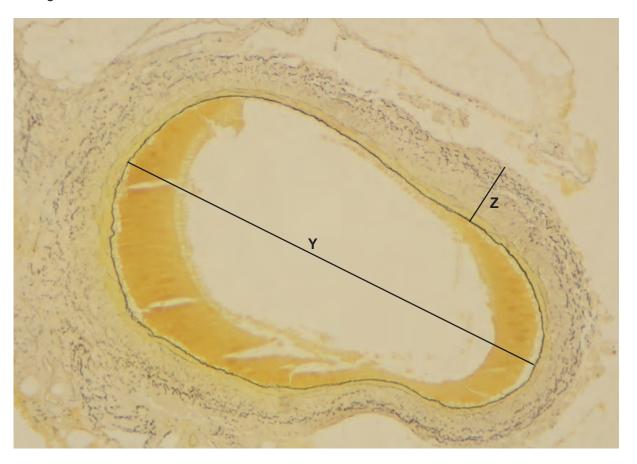

Fig. 2.2

(c) (i) Use the lines Y and Z shown on Fig. 2.2, to calculate the ratio of Y to Z. You will lose marks if you do not show all the steps in finding the ratio.

ialiu [3]	ratio	[3]	ı
-----------	-------	----	---	---

(ii)	The tubular specimen shown in Fig. 2.2 transports blood at low pressure. Suggest one observable feature which supports this conclusion.	Fo Exami Us
	[1]	
(iii)	Prepare the space below so that it is suitable for you to record the observable similarities and differences between the specimen on slide N1 and that in Fig. 2.2.	
	Record your observations in the space you have prepared.
