

UNIT 4 Transport and Gas Exchange

Timing This unit comprises approximately 20% of the learning material in AS Biology, and about 10% of the learning material in a complete Biology A Level learning programme.

Recommended Prior Knowledge Knowledge of cell structure, as covered in Unit 1, will be helpful here, as will an understanding of diffusion, osmosis and active transport.

Context This Unit considers the way in which cells are provided with their requirements. It builds on what students know of cell structure and movement into and out of cells, and lays the foundations for further work on physiology at A2 level. The work on blood in this Unit leads into the topic of immunity in Unit 5.

Outline The topic of transport is introduced by considering why large organisms need transport systems. Plant transport, including the relation between the structure and function of transport tissues, is then dealt with. Transport in mammals, including structure and function of the heart, blood vessels and blood, are considered, which leads into gas exchange in humans. If preferred, transport and gas exchange in mammals could be covered before transport in plants. There are good opportunities within this Unit for students to reinforce their practical skills relating to Assessment Objectives in Group C (Experimental skills and investigations), particularly in using the microscope to make observations and record them as drawings. Try to ensure that each student works alone and under time pressure on some occasions, as this will help to prepare for the practical examination(s).

Reinforcement and formative assessment < Reinforcement and formative assessment It is recommended that, towards the end of the time allocated to the unit, time be taken to permit reinforcement of the learning that has occurred. Small groups of two or three students could be encouraged to work together for an hour or two of lesson time, plus homework for a week or two. They should prepare a presentation of a topic to their peers. This could be in the form of a poster, a video, a PowerPoint presentation, an OHP illustrated talk...

Formative assessment could take the form of student self-marked minitests, taking just 10 or 15 minutes for students to do and then mark for themselves, perhaps using questions from online question banks such as <http://www.learncoie.org.uk/> or http://exam.net/public/misc/pub_home.asp – discussing the correct answers as a whole class. At the end of the unit, there should be a much larger formative assessment test, using appropriate past-examination and similar style questions, taking a lesson to do, and a lesson to provide feedback after marking by the teacher.

G(a)	<p>explain the need for transport systems in multicellular plants and animals in terms of size and surface area to volume ratio</p> <p>Learning activities</p> <ul style="list-style-type: none"> – use cubes and questions with diagrams to build understanding of: the relationship between surface area and volume; the distance from the outside to the inside; for smaller and larger shapes, and for long-thin, flat and cuboidal / spherical shapes – examine a circus of different organisms macroscopically and microscopically for features of their transport, gas and nutrient / waste exchange systems – using whole fresh and preserved specimens, microscope slides, photomicrographs and the CIE Bioscope 	<p>Use small cubes to build 'organisms'. Students can build cubic organisms with different numbers of blocks, and calculate surface area to volume ratios to discover how this ratio decreases as volume increases. They can also build organisms using the same number of blocks (i.e. the same volume) of different shapes, to illustrate how flattened organisms have larger surface area to volume ratios than 'cubic' ones. Discuss how this relates to the need for transport systems for gases, as well as nutrients and other substances, in animals.</p> <p>Discuss the way in which the branching shape of plants brings a very large surface area into contact with air, so there is no need for a transport system for gases. However, water must be transported from roots to leaves, and nutrients from sources to sinks.</p>	<p>CIE Bioscope</p> <p>http://teachers.net/lessons/posts/2518.html protocol for surface area: volume investigation</p> <p>http://employees.csbsju.edu/ssaupe/biol116/surf-vol-ratio.htm series of exercises on surface area: volume ratio</p>	<p>Gelatine, or better agar, blocks can be coloured using a pH indicator such as cresol red or phenolphthalein. When dropped into hydrochloric acid, the blocks change colour. Blocks can be cut to represent 'cubic' organism and the effect of surface area to volume ratio on diffusion may be measured.</p> <p>There is a protocol in <i>Advanced Biology principles and applications. Study Guide</i> Clegg and Mackean</p> <p><i>Biofactsheet 7: Comparing transport in plants and animals.</i></p> <p><i>Biofactsheet 81: Gas exchange in plants</i></p> <p><i>Biology</i>, Jones, Fosbery , Taylor and Gregory and other textbooks include this topic</p>

G(g) (h)	<p>explain the movement of water between plant cells and between them and their environment, in terms of water potential; describe the pathways and explain the mechanisms by which water is transported from soil to xylem and from roots to leaves</p> <p>Learning activities</p> <ul style="list-style-type: none"> – review water potential with oral question and answer / whole class discussion and revision questions – work out which way water will flow to and from cells / environments with given water potentials (no calculations of water potential are expected) – build understanding of mechanisms and pathways of movement of water through plants with oral question and answer / whole class discussion and written questions – give brief written explanation why water flows as a result of water potential, and the flow of water from soil, through plant, to air as a result of water potential (including the role of cohesion-tension), and other potential and actual mechanisms of water flow 	<p>Use questioning to revise earlier work on osmosis, and lead in to the way in which root hairs provide a large surface area for water uptake. Root hairs can be seen clearly on newly-germinated seedlings, such as mung beans, if these are grown on damp filter paper or cotton wool.</p> <p>Provide an overview of the movement of water down a water potential gradient from soil to air, before looking at each part of this pathway in more detail.</p> <p>The work on cohesion-tension needs to be linked to the next section (G(b)(c)) on transpiration. Transpiration reduces the water potential at the top of the plant, producing the ‘tension’.</p>	<p>http://www.microscopy-uk.org.uk/mag/artmar00/watermvt.html A clear description of water movement through a plant, including high-quality micrographs.</p> <p>http://web.ukonline.co.uk/webwise/spinneret/plants/pltsu.htm interactive questions and answers (hold mouse over answer to reveal)</p> <p>http://www.mhhe.com/biosci/pae/botany/histology/html/membrans.htm nice description of symplast and apoplast</p> <p>http://users.rcn.com/jkimball.ma.ultranet/BiologyPages/X/Xylem.html detailed information on transport across roots and up xylem</p>	<p>BIOFACTSHEET 82: TRANSPORT IN FLOWERING PLANTS</p> <p><i>Biofactsheet 108: Water movement across the root.</i></p> <p><i>Biology, Jones, Fosbery , Taylor and Gregory and other textbooks include this topic</i></p>

	<p>(root pressure and capillarity)</p> <ul style="list-style-type: none">– research in books and on the web, the various pathways by which water can flow across the root (apoplast, symplast and vacuolar) and the role of the endodermis and casparian strip, giving a brief written / diagrammatic summary of your findings			
--	--	--	--	--

	Learning Outcomes	Suggested Teaching Activities	Online Resources	Other resources
G(b) (c)	<p>define the term <i>transpiration</i> and explain that it is an inevitable consequence of gas exchange in plants;</p> <p>describe how to investigate experimentally the factors that affect transpiration rate</p> <p>Learning activities</p> <ul style="list-style-type: none"> – review and build understanding of transpiration with oral question and answer / whole class discussion and written questions – give a brief written explanation of transpiration, explain why it is inevitable, and what use is made of it – use a potometer to investigate the effect of wind speed on rate of transpiration – plan and carry out a controlled investigation into the effect of temperature on rate of transpiration – plan and / or carry out similar investigations into the effect of humidity and / or light on rate of transpiration 	<p>Use questioning to help students to revise what they remember from earlier courses about transpiration. Discuss how water changes state from liquid to vapour inside the leaf, and then diffuses down a water potential gradient through open stomata into the surrounding air. This needs to be linked to cohesion-tension the previous section (G(g)(h)), in which the loss of water from the leaf reduces hydrostatic pressure at the top of xylem vessels, thus providing the pressure gradient which ensures mass flow of water up these vessels.</p> <p>A simple potometer can be made using a long piece of capillary tubing to which a short length of rubber tubing is attached at one end. Submerge it all in water and shake gently until water completely fills it. Make a slanting cut across a leafy shoot, and - still under water - push this tightly into the rubber tubing. Support the whole apparatus vertically and record the height of the air/water meniscus at suitable time intervals.</p> <p>If you have access to data-logging equipment and a humidity-recording sensor, you could try enclosing part of a plant inside a plastic bag and recording the increase in humidity as transpiration takes place.</p>	<p>http://users.rcn.com/jkimball.ma.ultranet/BiologyPages/T/Transpiration.html information and links to related topics</p> <p>http://www.geog.ouc.bc.ca/physgeog/contents/8i.html clear explanation of the relationship between evaporation and transpiration</p> <p>http://cas.bellarmine.edu/tietjen/Laboratories/Transpiration/transpiration_text.htm has a simulation program that allows you to investigate the effect on transpiration of changing various parameters</p>	<p>Both <i>Practical Advanced Biology</i>, King et al, and <i>Comprehensive Practical Biology</i>, Siddiqui have protocols for investigations relating to transpiration.</p> <p>Students need reminding that potometers measure rates of water uptake. If a potometer is placed on a balance sensitive to small changes in mass, then it is possible to measure water uptake <i>and</i> transpiration.</p> <p><i>Biofactsheet 64: Transpiration</i></p> <p><i>Biology</i>, Jones, Fosbery , Taylor and Gregory and other textbooks include this topic</p>

H(d)	<p>describe the process of gas exchange between air in the alveoli and the blood</p> <p>Learning activities</p> <ul style="list-style-type: none"> – annotate diagrams with key features of the process such as mass transport of materials (e.g. ventilation of larger bronchioles, blood flow), diffusion in / out of alveoli / smaller bronchioles (fast) in air, maximising diffusion gradients across alveolar membrane, minimising diffusion distance from alveolar air to blood plasma and cells so that slow diffusion in liquid is not a problem 	<p>Students will already have covered this, but they can now relate their knowledge to diffusion across cell membranes, and to the roles of blood flow and ventilation in maintaining diffusion gradients for oxygen and carbon dioxide between the alveoli and blood.</p>	<p>http://science.nhmccd.edu/biol/respiratory/alveoli.htm</p> <p>series of photomicrographs and animation about alveolus / capillary gas exchange</p> <p>http://www.pdh-odp.co.uk/diffusion.htm</p> <p>information and illustration</p>	<p><i>Biology</i>, Jones, Fosbery , Taylor and Gregory and other textbooks include this topic</p>

H(e)	<p>explain the terms <i>tidal volume</i> and <i>vital capacity</i></p> <p>Learning activities</p> <ul style="list-style-type: none"> – measure vital capacity using a simple volume-measuring spirometer or a large empty plastic bag into which a complete breath is blown, and which is then sealed and pushed into a calibrated bucket to see how large a volume of trapped air it contains. – tidal volume should only be measured using a spirometer containing soda-lime to absorb CO₂ and charged before use with medical oxygen (to avoid potential danger of poisoning) – home-made spirometers are possible, using plastic tube at least 1.5 cm internal diameter, an oxygen-filled beaker loosely kept upside down over water, and a soda-lime CO₂ absorber 	<p>If you have a spirometer or suitable data-logging apparatus available, use this to allow students to measure their own tidal volumes and vital capacity. If not, provide data for them to analyse.</p>	<p>http://en.wikipedia.org/wiki/Vital_capacity straight forward summary</p>	<p><i>Biology</i>, Jones, Fosbery, Taylor and Gregory. has spirometer data and questions (with answers) involving their interpretation.</p>
