# MARK SCHEME for the May/June 2013 series

# 9701 CHEMISTRY

9701/41

Paper 4 (A2 Structured Questions), maximum raw mark 100

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge will not enter into discussions about these mark schemes.

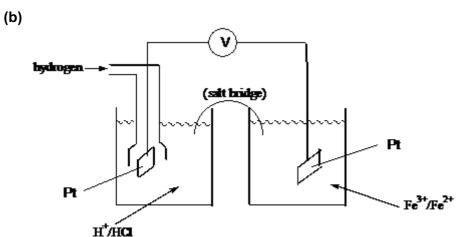

Cambridge is publishing the mark schemes for the May/June 2013 series for most IGCSE, GCE Advanced Level and Advanced Subsidiary Level components and some Ordinary Level components.

| Page 2 | Mark Scheme                 | Syllabus | Paper |
|--------|-----------------------------|----------|-------|
|        | GCE A LEVEL – May/June 2013 | 9701     | 41    |

(a) The potential of an electrode compared to that of a standard hydrogen electrode (SHE) or the EMF of a cell composed of the test electrode and the SHE
 [1]

all measurement concentrations of 1 mol dm<sup>-3</sup> and 298 K/1 atm pressure [1]

 $H_2$  and good delivery system [1]  $Fe^{2+}/Fe^{3+}$  solution labelled [1] platinum electrodes (both) [1] salt bridge and voltmeter [1]  $H^+$  or HCl or H<sub>2</sub>SO<sub>4</sub> [1] (acid is not sufficient) [5]

(c) (i) 
$$E^{\ominus} = 0.77 - 0.54 = 0.23$$
 (V) [1]

(ii) Since  $E^{\ominus}$  is positive/  $E^{\ominus} > 0$ 

So more products / the equilibrium will be over to the right / forward reaction is favoured ecf from (c)(i) [1]

(iii)  $K_c = [Fe^{2+}]^2 [I_2] / [Fe^{3+}]^2 [I^-]^2$  [1]

units are **mol<sup>-1</sup> dm**<sup>3</sup> ecf on expression

(iv) ([Fe<sup>2+</sup>] must always be twice [I<sub>2</sub>], so) [Fe<sup>2+</sup>] = 0.02 (mol dm<sup>-3</sup>) [1]

([I<sup>-</sup>] must always be equal to [Fe<sup>3+</sup>], so) [I<sup>-</sup>] =  $2 \times 10^{-4}$  (mol dm<sup>-3</sup>) [1]

(v)  $K_c = \{(0.02)^2 \times 0.01\} / \{(2 \times 10^{-4})^2 \times (2 \times 10^{-4})^2\}$  correct expression [1] (allow ecf from incorrect expression in (c)(iii)) (allow ecf from (c)(iv)) =  $(4 \times 10^{-6}) / (1.6 \times 10^{-1.5}) = 2.5 \times 10^9 (\text{mol}^{-1} \text{ dm}^3)$  [1]

[8]

| Page 3 | Mark Scheme                 | Syllabus | Paper |
|--------|-----------------------------|----------|-------|
|        | GCE A LEVEL – May/June 2013 | 9701     | 41    |

plotting of points (-1 for any error - plotted to within 1/2 square) [1] a good best fit curve [1]

(ii) construction lines for two half-lives and  $t_{\frac{1}{2}} \approx 63$  m or 32 m (±3 min) /  $t_{\frac{1}{2}}$  is constant or construction lines for two tangents and mention of two values / concentration doubled, [1] rate doubled (iii) either ratio of (initial) rates (slopes) or ratio of  $t_{\frac{1}{2}}$  = 2.0 [1]

so reaction is first order w.r.t. [HC1]

because HCl is a catalyst

(ii)

#### (iv) rate = k[CH<sub>3</sub>CO<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>][HC*l*] conditional on (a)(iii) and ecf from (a)(iii) [1]

| (initial) rate = 0.2/95 or 0.2/47  |     |
|--|-----|
| ≈ $2.1 \times 10^{-3}$ or $4.3 \times 10^{-3}$ (mol dm <sup>-3</sup> min <sup>-1</sup> ) | [1] |

$$k = 2.1 \times 10^{-3} / (0.2 \times 0.1) \text{ or } 4.3 \times 10^{-3} / (0.2 \times 0.2)$$
  

$$\approx 0.11 \text{ (mol}^{-1} \text{ dm}^3 \text{ min}^{-1})$$
[1]

[8 max 7]

- (b) (i) because H<sub>2</sub>O is the solvent or its concentration cannot change [1]
  - [1] [2]

## 7 (a) Any four from:

- extract DNA
- use restriction enzymes (to break DNA into fragments)
- use polymerase chain reaction (to increase concentration of fragments)
- place samples on (agarose) gel
- carry out electrophoresis
- label fragments (transferred to a membrane) with radioactive isotope
