Paper 3

**October/November 2013**

**2 hours**

Candidates answer on the Question Paper.

No additional materials are required.

No calculators allowed.

**READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a soft pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

**DO NOT WRITE IN ANY BARCODES.**

Answer **all** questions.

No marks will be awarded for using brand names for software packages or hardware.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.

This document consists of **19** printed pages and **1** blank page.

1 (a) Convert the following infix expressions into reverse Polish notation:

(i)  $(x - y) / 5$

.....  
 ..... [1]

(ii)  $2 / (4 * a + 1)$

.....  
 ..... [2]

(b) What is the value of this reverse Polish expression:

$$a b + c d - /$$

for  $a = 7, b = 5, c = 8$  and  $d = 2$ ?

Show your working.

.....  
 ..... [2]

(c) A binary tree can be used to represent an expression or a statement.

For  
Examiner's  
Use

The diagram shows the binary tree for the infix expression:

$$1 / 2 * b * h$$

(i) Explain how the infix form for this expression is produced using a tree traversal.

.....  
 ..... [1]

(ii) What is the reverse Polish notation for this expression?

.....  
 ..... [1]

(iii) Explain how the reverse Polish notation is produced using a tree traversal.

.....  
 ..... [1]

2 Customers order products from a website.

- An order contains one or more products.
- Over time, a customer places many orders.
- A product will appear on many customer orders.
- Each product is sourced from a single supplier and a number of suppliers are used.
- A supplier can supply more than one product.

At present the company stores and manages all the data using flat files.

(a) Describe **three** advantages that a relational database would have over the use of flat files.

1 .....

.....

2 .....

.....

3 .....

..... [3]

(b) (i) What is the relationship between product and supplier?

..... [1]

(ii) What is the relationship between product and order?

..... [1]

(c) A database solution is to be developed.  
Two of the tables are PRODUCT and ORDER.

(i) Draw an entity-relationship (E-R) diagram showing a database design which can be produced so that the product and order data are fully normalised.

[2]

(ii) Explain how the relationships are implemented.

.....

.....

.....

..... [2]

(d) The following table design is suggested for PRODUCT.

```
PRODUCT (ProductID, ProductDescription, RetailPrice, SupplierID,
         SupplierName, SupplierTelNumber)
```

This is poorly designed.

(i) Is this table in First Norm Form (1NF)?  
Explain.

.....

..... [1]

(ii) Is this table in Second Normal form (2NF)?  
Explain.

.....

..... [1]

(iii) The table is not in Third Normal Form (3NF).  
Explain.

.....

..... [1]

(iv) Using only the attributes given in the PRODUCT table above, produce a new design  
which is fully normalised.

The table descriptions should be expressed as:

```
TableName (Attribute1, Attribute2, Attribute3, ...)
```

.....

.....

.....

..... [2]

(e) Explain why all tables in the final design should be fully normalised.

.....

.....

.....

..... [2]

(f) The table to store the order data has the following design:

```
ORDER(OrderNo, OrderDate, OrderTime, IsPaid, OrderAmountPaid,
      PaymentMethod, CustomerID)
```

- IsPaid has data type Boolean
- PaymentMethod has data type Char with possible values: C - credit card, D - debit card, A - account customer

Write a Data Manipulation Language (DML) query to report orders which were placed on the 15 January 2013 and paid for using a debit card. Show the customer ID and order number only.

Use the keywords SELECT, FROM, WHERE.

.....

.....

.....

.....

.....

..... [3]

3 (a) Describe what is meant by a register.

.....

.....

..... [2]

(b) (i) Convert the denary number 60 into hexadecimal.

..... [1]

(ii) Convert the hexadecimal number 10F into denary.

..... [1]

(d) The following table shows some of a processor's instruction set in assembly language.

For  
Examiner's  
Use

Instruction		Explanation
Op Code	Operand	
LIX	<address>	Load the contents of the address to the Index register (IX)
LDX	<address>	Indexed addressing. Form the address as <address> + the contents of IX. Copy the contents of this address to ACC
STO	<address>	Store the contents of ACC at the given address
ADD	<address>	Add the contents of the given address to the ACC
INC	<register>	Add 1 to the contents of the register (ACC or IX)
JMP	<address>	Jump to the given address

The following program is to be executed.  
Shown are:

- the first six instructions of this program
- the memory locations which will be accessed by this program.

Address	Main memory contents
100	LIX 200
101	LDX 200
102	ADD 204
103	STO 204
104	INC IX
105	JMP 101
200	1
201	13
202	14
203	22
204	0

(b) The following scenario is to be implemented with object-oriented programming.

A software company stores data for all employees (EMPLOYEE). The company employs admin staff (ADMIN) and project staff (PROJECTSTAFF). Project staff are either programmers (PROGRAMMER) or technical authors (TECHAUTHOR).

Data stored will include:

- employee ID for employees
- specialist programming language for programmers
- software specialism for technical authors
- full time or part time indicator
- department for admin staff
- salary grade
- the project team that project staff are assigned to

Complete the class diagram showing the classes and properties only for the data given above.

For  
Examiner's  
Use

[8]

(c) Explain what is meant by encapsulation.

.....

.....

.....

..... [2]

*For  
Examiner's  
Use*

5 Customer names are stored in the array `Customer`.

An algorithm is to be designed to perform a serial search of the array for a requested customer name.

The algorithm will use the variables shown in the table.

(a) Study the table and the algorithm and fill in the gaps.

Identifier	Data Type	Description
Customer	ARRAY[100] OF STRING	Array of customer names
Index	INTEGER	Used to index the array elements
IsFound	.....	.....
SearchName	STRING	The requested customer name

```

//Serial search algorithm
INPUT .....
IsFound ← FALSE
Index ← 1

REPEAT
    IF ..... = SearchName
        THEN
            IsFound ← TRUE
            OUTPUT "Found at position " Index
        ELSE
            .....
    ENDIF
UNTIL (IsFound = TRUE) OR .....

IF .....
    THEN
        OUTPUT "Customer name was NOT FOUND"
    ENDIF
ENDIF

```

[7]

**(b)** How many comparisons on average will be needed to find a requested customer from the Customer array?

[1]

(c) A binary search may be an alternative algorithm to a serial search.

(i) What condition is put on the `Customer` array for a binary search to be used?

..... [1]

The following recursive function is for the binary search algorithm.

```

FUNCTION BinarySearch(ThisArray, FindValue, Low, High) : INTEGER
  IF High < Low
    THEN
      RETURN -1 // not found
    ELSE
      Middle ← INT((High + Low) / 2)
      IF ThisArray[Middle] > FindValue
        THEN
          BinarySearch(ThisArray, FindValue, Low,
                      Middle - 1)
        ELSE
          IF (ThisArray[Middle] < FindValue)
            THEN
              BinarySearch(ThisArray, FindValue,
                          Middle + 1, High)
            ELSE
              RETURN Middle // found
            ENDIF
          ENDIF
        ENDIF
      ENDIF
    ENDIF
  ENDFUNCTION

```

(ii) How can you recognise that the function is recursive?

..... [1]

For  
Examiner's  
Use

(iii) A binary search is carried out on the data in the Surname array shown.

	Surname
1	Ban
2	Chae
3	Dang
4	Hwang
5	Jeong
6	Jin
7	Jo
8	Ju
9	Ma
10	So
11	Song

For  
Examiner's  
Use

Complete the trace table below for the following function call:

BinarySearch (Surname, "Hwang", 1, 11)

Low	High	Middle	RETURN
1	11		

[4]

- (iii) The representation used 8 bits for the mantissa and 4 bits for the exponent. This is to be redesigned. The number of bits used for the mantissa and the exponent is changed, but the total number of bits remains 12.

*For  
Examiner's  
Use*

What implications does this have for the range and precision of numbers that can be represented?

.....  
.....  
.....  
..... [2]

7 The encryption of data is widely used in computing.

(a) One application is online banking.

State **two** other applications where encryption is used.  
Describe the reason for encrypting the data for each application.

Application 1 .....

Reason .....

.....

Application 2 .....

Reason .....

..... [4]

(b) Explain the terms plain text and cipher text.

Plain text .....

.....

Cipher text .....

..... [2]

(c) Symmetric encryption uses a single key.

Explain how a message is encrypted and decrypted using symmetric encryption.

.....

.....

.....

.....

.....

..... [3]

(d) Authorisation and authentication are processes designed to protect the computer system and data.

*For  
Examiner's  
Use*

Give **one** technique used for each.

Authorisation .....

.....

Authentication .....

..... [2]
