0653/51

Paper 5 Practical Test

May/June 2010

1 hour 30 minutes

Candidates answer on the Question Paper.

Additional Materials: As listed in Instructions to Supervisors.

#### **READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES.

Answer all questions.

Chemistry practical notes for this paper are printed on page 12.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.

For Examiner's Use

This document consists of 9 printed pages and 3 blank pages.

		lants show differences in the structure of a leader and a leader are a leader are a leader.	f growing in a sunny area (sun le	eaf), For Examiner's Use
(a)	(i)	You are supplied with two leaves, labelled shade leaf.	sun leaf and another leaf labe	lled
		Make drawings of the two leaves in the space size.	es provided to show the difference	e in
		sun leaf	shade leaf	[2]
	lenç	gth of sun leaf = mm length	of shaded leaf =mmm	[2]
	(ii)	Measure and record the maximum length of the petiole (stalk). Write your measurements be		ling
(b)	One	e leaf has a larger surface area than the other.		
	Sug	ggest an advantage to the leaf with the larger so	urface.	
				[1]

© UCLES 2010

1

(c) Fig. 1.1 shows cross sections of a sun leaf and a shade leaf as viewed using a microscope.

For Examiner's Use

Fig. 1.1

(i) Construct a table to compare the two diagrams shown in Fig. 1.1. Include the following features; thickness of leaf, number of palisade cells, size of air spaces.

[4]

(ii) The sun leaf usually has a thicker cuticle than the shade leaf. The cuticle is a waxy layer covering the leaf.

Suggest an advantage that this thicker cuticle gives to the sun leaf.

[1]

2 You are going to make some measurements on a test-tube before using it to determine the density of **liquid P**.

For Examiner's Use

(a) Measure and record the length, *I*, and the internal diameter, **D**, of the test-tube.

$$l =$$
 mm  $D =$  mm

Using these measurements, calculate the volume of the tube using the formula

$$\pi \times \left(\frac{\mathbf{D}}{2}\right)^2 \times \mathbf{l}$$

volume of test-tube = \_\_\_\_\_mmm<sup>3</sup> [3]

(b) (i) Hold the test-tube in the glass beaker labelled water and add dry sand to the tube until it floats with its open end about 10 mm above the surface. Place a rule in the water beside the tube and measure the depth, d<sub>1</sub> from the water surface to the bottom of the test-tube. See Fig. 2.1. You may need to hold the tube upright to do this.

Record this value,  $d_1$  in Table 2.2 on page 5.

Fig. 2.1

(ii) Remove the test-tube from the water and wipe the outside, taking care not to lose any sand. Do not let water splash into the test-tube. Place the test-tube in the beaker labelled **liquid P** and as before, measure the depth,  $\mathbf{d}_2$ .

Record this value,  $d_2$  in the first line of Table 2.2.

(iii) Remove the test-tube and wipe the outside. Empty out a small amount of sand so that it floats in the water with the open end about 12 or 13 mm above the surface.

Measure and record  $d_1$ , the new depth in Table 2.2.

As before, wipe the outside of the test-tube and transfer it to the **liquid P**.

For Examiner's Use

Measure and record the new depth  $d_2$  in Table 2.2.

(iv) Repeat the process with the tube floating about 2 or 3 mm higher in water each time, until you have five sets of readings of  $d_1$  and  $d_2$ .

Record all your values in Table 2.2.

Table 2.2

d₁in water/mm	d₂in liquid P/mm

[3]

(c) On the grid provided on page 6 (Fig. 2.2), plot a graph of d<sub>1</sub> (vertical axis) against d<sub>2</sub>.Draw the best straight line through your points.

For Examiner's Use

 $d_2/mm$ 

Fig. 2.2

[3]

(d) Calculate the gradient of the line, indicating on your graph the values chosen to enable you to do this. The gradient is numerically equal to the density of **liquid P** in grams per centimetre.

gradient of line = [1]

 $d_1/mm$ 

# **BLANK PAGE**

Please turn over for Question 3.

3	<b>X</b> , <b>Y</b> and <b>Z</b> are solutions of the same acid but different concentrations. You will use alkali, solution <b>A</b> , to find which of the acid solutions is the most concentrated. You will also carry out tests to identify the acid.										
		Usi	-	g pipette provided, and i	no other apparatus, es	stimate the volume of a					
				٧	volume of 1 drop =	cm <sup>3</sup> [1]					
	(b)	) (i) Using the small measuring cylinder, place 5 cm³ of solution <b>X</b> in a test-tube. Add 2 drops of the indicator. Use the dropping pipette to add the alkali, solution <b>A</b> , a drop at a time, counting the drops. Shake the tube after each addition until a pink colour is produced.									
		Record the number of drops in Table 3.1.									
		(ii) Repeat the procedure using solution, Y, and then Z.									
		Record the number of drops in Table 3.1.									
	Table 3.1										
				solution	number of drops						
				x							
				Y							
				Z							
						_ [3]					
	(c)	Wh	ich of the solution	ons is the most concent	rated? Explain your ar	iswer.					
						[1]					
	(d)			of solution <b>X</b> in a test-tu wing splint and a lighted		gnesium. Test any gas					
		Red	cord your obser	vation and name the ga	s given off.						
		glov	wing splint								
		ligh	ted splint								
		nan	ne of the gas			[3]					

For Examiner's Use

(e)	Place about $2\mathrm{cm}^3$ of solution $\mathbf X$ in a test-tube and add a few drops of aqueous silver nitrate.	For Examiner's Use
	Record your observation and name the acid in solution <b>X</b> .	
	observation	
	name of the acid [2]

## **CHEMISTRY PRACTICAL NOTES**

## **Test for anions**

anion	test	test result
carbonate (CO <sub>3</sub> <sup>2-</sup> )	add dilute acid	effervescence, carbon dioxide produced
chloride (C <i>l</i> ·) [in solution]	acidify with dilute nitric acid, then add aqueous silver nitrate	white ppt.
nitrate (NO <sub>3</sub> -) [in solution]	add aqueous sodium hydroxide then aluminium foil; warm carefully	ammonia produced
sulfate (SO <sub>4</sub> <sup>2-</sup> ) [in solution]	acidify then add aqueous barium chloride <i>or</i> aqueous barium nitrate	white ppt.

# Test for aqueous cations

cation	effect of aqueous sodium hydroxide	effect of aqueous ammonia						
ammonium (NH <sub>4</sub> <sup>+</sup> )	ammonia produced on warming	<u>-</u>						
copper(II) (Cu <sup>2+</sup> )	light blue ppt., insoluble in excess	light blue ppt., soluble in excess giving a dark blue solution						
iron(II) (Fe <sup>2+</sup> )	green ppt., insoluble in excess	green ppt., insoluble in excess						
iron(III) (Fe <sup>3+</sup> )	red-brown ppt., insoluble in excess	red-brown ppt., insoluble in excess						
zinc (Zn <sup>2+</sup> )	white ppt., soluble in excess giving a colourless solution	white ppt., soluble in excess giving a colourless solution						

## **Test for gases**

gas	test and test results							
ammonia (NH <sub>3</sub> )	turns damp red litmus paper blue							
carbon dioxide (CO <sub>2</sub> )	turns limewater milky							
chlorine (Cl <sub>2</sub> )	bleaches damp litmus paper							
hydrogen (H <sub>2</sub> )	"pops" with a lighted splint							
oxygen (O <sub>2</sub> )	relights a glowing splint
