0653/52

May/June 2013

1 hour 30 minutes

Candidates answer on the Question Paper.

Additional Materials: As listed in the Confidential Instructions

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES.

Answer **all** questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

Chemistry practical notes for this paper are printed on page 12.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

For Examiner's Use	
1	
2	
3	
Total	

This document consists of **10** printed pages and **2** blank pages.

- 1 You are provided with two plants, **A** and **B**, each of which has been enclosed in a transparent polythene bag for a period of two days. In the bag around plant **A** there is a chemical that absorbs carbon dioxide. Both plants have had parts of some of their leaves covered with black paper.

For
Examiner's
Use

Fig. 1.1

- (a) Remove one leaf from each plant, choosing leaves that have been partly covered with black paper. Take care to remember which leaf came from which plant. In the space below, make clear labelled drawings of the two leaves to show which parts are covered with the black paper.

leaf from plant **A**

leaf from plant **B**

[4]

(b) Now test both leaves for starch. You can carry out the test on both leaves at the same time, but it is important to remember which leaf is which.

- Half fill a beaker with water, and bring it to the boil (you may have a water bath instead).
- Remove the black paper from the leaf.
- Place the leaf in the hot water, and let it stay there for 1 to 2 minutes.
- **Turn off any Bunsen burner or other naked flame. This is important for safety.**
- Use tweezers to remove the leaf from the hot water, and place the leaf in a clean test-tube.
- Add alcohol to the test-tube, so it covers the leaf, and place this test-tube into the beaker or water bath that contains the hot water.
- Leave the tube in the hot water for five minutes (during this time the alcohol may boil).
- After five minutes, remove the tube from the hot water, and carefully pour away the alcohol into the waste container provided.
- Pick up the leaf with tweezers, and dip it briefly back into the hot water.
- Spread the leaf out on a white tile, and cover it with iodine solution.
- Wait about one minute. Then, in the space below, make two clear pencil drawings of the two leaves. Label them to show the colours of the different parts.

leaf from plant **A**

leaf from plant **B**

[3]

(c) Look at your drawings for parts (a) and (b). Summarise your results in Table 1.1.

Table 1.1

		colour obtained with iodine	starch is present (yes or no)
leaf from plant A	area covered by black paper		
	area not covered by black paper		
leaf from plant B	area covered by black paper		
	area not covered by black paper		

[2]

(d) Compare the results that you have recorded in Table 1.1 for the uncovered parts of the leaves from plant **A** and plant **B**.

Use these results to write a conclusion about a condition necessary for photosynthesis.

Examiner's
Use

BLANK PAGE

- 2 In this experiment, you will be investigating the period of a simple pendulum. The period is the time for one complete to-and-fro swing (oscillation) of the pendulum.

For
Examiner's
Use

1 complete oscillation is the time taken for the bob to swing from **A** to **B** and back to **A** again.

Fig. 2.1

The pendulum has been set up for you with its point of support at **exactly** 55.0 cm above the bench.

Do not adjust this height, or the position of the clamp.

Fig. 2.2

- (a) Without altering the height of the clamp above the bench, adjust the length of the thread until the height, h , of the centre of the bob above the bench is 10.0 cm.

For
Examiner's
Use

Give the bob a small sideways displacement and release it so that it oscillates.

Record in Table 2.1 the time taken for 20 complete oscillations. Record your times to the nearest second.

Table 2.1

h/cm	time for 20 oscillations/s	period T/s	T^2/s^2
10.0			
20.0			
30.0			
40.0			

Repeat the procedure for heights h of 20.0 cm, 30.0 cm and 40.0 cm.

Record the times for 20 oscillations for each height, in Table 2.1. [3]

- (b) (i) Use your results in Table 2.1 to calculate the period T of the pendulum for each set of readings. Remember that the period is the time for one complete oscillation.

Record your values in Table 2.1. [1]

- (ii) Calculate the value of T^2 for each set of readings and enter your values in Table 2.1 to 2 decimal places. [1]

- (c) (i) On the grid provided, plot a graph of T^2/s^2 (vertical axis) against h/cm (horizontal axis).

Start both axes of your graph from the origin (0,0).

Draw the best fit straight line.

T^2/s^2

 h/cm

[3]

(ii) Calculate the gradient of your line.

Show all working and indicate on your graph the values you chose to enable the gradient to be calculated.

gradient of line = [2]

- 3 Three solutions **A**, **B** and **C** are ammonia solution, dilute hydrochloric acid and sodium hydroxide solution. It is not known which solution is which.

For
Examiner's
Use

You are going to carry out the following tests on solutions **A**, **B** and **C** to identify them.

Place about 1 cm³ of each solution **A**, **B** and **C** into separate test-tubes. Label your test-tubes so that you know which solution is in which test-tube.

- (a) Add 3 drops of Universal Indicator to the separate portions of the solutions **A**, **B** and **C** in the test-tubes and record the final colours in the row of Table 3.1 marked (i).

Pour each solution into the waste beaker. Wash out the test-tubes between each test.

Carry out the tests (ii) and (iii) as described in Table 3.1. Use separate portions of about 1 cm³ of solutions **A**, **B** and **C** in test-tubes and record the observations in the rows of Table 3.1 marked (ii) and (iii) respectively.

Table 3.1

test		solution A	solution B	solution C	
(i)	add 3 drops of Universal Indicator				[1]
(ii)	add an equal volume of silver nitrate solution				[2]
(iii)	add a few drops of copper sulfate solution				[3]

(b) Use your observations in Table 3.1 to make the following conclusions.

(i) State which solutions are shown to be alkaline by test (a)(i).

..... [1]

(ii) State which solution is ammonia solution **and** state which test, other than (a)(i), confirms this.

ammonia solution is solution

confirmed by

..... [1]

(iii) State which solution is sodium hydroxide **and** state which test, other than (a)(i), confirms this.

sodium hydroxide is solution

confirmed by

..... [1]

(iv) State which solution is hydrochloric acid **and** state which test, other than (a)(i), confirms this.

hydrochloric acid is solution

confirmed by

..... [1]

CHEMISTRY PRACTICAL NOTES

Test for anions

<i>anion</i>	<i>test</i>	<i>test result</i>
carbonate (CO_3^{2-})	add dilute acid	effervescence, carbon dioxide produced
chloride (Cl^-) [in solution]	acidify with dilute nitric acid, then add aqueous silver nitrate	white ppt.
nitrate (NO_3^-) [in solution]	add aqueous sodium hydroxide then aluminium foil; warm carefully	ammonia produced
sulfate (SO_4^{2-}) [in solution]	acidify then add aqueous barium chloride <i>or</i> aqueous barium nitrate	white ppt.

Test for aqueous cations

<i>cation</i>	<i>effect of aqueous sodium hydroxide</i>	<i>effect of aqueous ammonia</i>
ammonium (NH_4^+)	ammonia produced on warming	-
copper(II) (Cu^{2+})	light blue ppt., insoluble in excess	light blue ppt., soluble in excess giving a dark blue solution
iron(II) (Fe^{2+})	green ppt., insoluble in excess	green ppt., insoluble in excess
iron(III) (Fe^{3+})	red-brown ppt., insoluble in excess	red-brown ppt., insoluble in excess
zinc (Zn^{2+})	white ppt., soluble in excess giving a colourless solution	white ppt., soluble in excess giving a colourless solution

Test for gases

<i>gas</i>	<i>test and test results</i>
ammonia (NH_3)	turns damp red litmus paper blue
carbon dioxide (CO_2)	turns limewater milky
chlorine (Cl_2)	bleaches damp litmus paper
hydrogen (H_2)	“pops” with a lighted splint
oxygen (O_2)	relights a glowing splint
