Paper 6 Alternative to Practical

October/November 2009

1 hour

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a soft pencil for any diagrams or graphs.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES.

Answer all questions.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

For Exam	iner's Use

This document consists of 19 printed pages and 5 blank pages.

1 A student has found three automobile lamps at the scrap yard.

The student finds some printing on the lamps, and copies this into Fig. 1.1.

For Examiner's Use

lamp	what is printe	ed on the lamp
1	24 V	36 W
2	12 V	18 W
3	6 V	18 W

Fig. 1.1

He wants to compare the resistances of the three lamps using the circuit shown in Fig. 1.2.

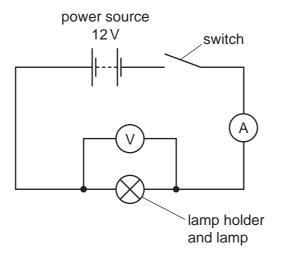

Fig. 1.2

- The student inserts lamp 1 into the lampholder.
- He closes the switch.
- He reads the voltmeter and ammeter and records the readings in Fig. 1.3.
- He repeats the experiment using lamp 2.

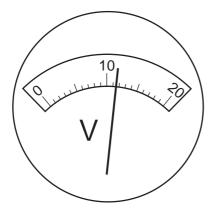

lamp	voltmeter reading/V	ammeter reading/A	brightness of the lamp
1	11.9	0.72	dim
2			bright

Fig. 1.3

(a) The ammeter and voltmeter readings for lamp 2 are shown in Fig. 1.4. Record the readings in Fig. 1.3.

For Examiner's Use

[2]

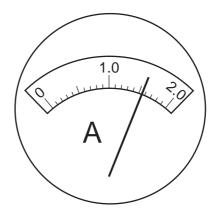

Fig. 1.4

- (b) The student wants to use the equation V = IR to find the resistance of the lamps 1 and 2.
 - (i) Rearrange the equation V = IR.

(ii) Calculate the resistance of lamp 1 using the data from Fig. 1.3.

(iii) Calculate the resistance of lamp 2 using the data from Fig. 1.3.

resistance of lamp 2 = _____ohms [1]

(c)	He	student repeats the experiment with lamp 3 . fixes the lamp in the lampholder and closes the switch. The lamp glows brightly for nort time and then the ammeter reading falls to 0.
		e data from Fig. 1.1 and 1.3 to help you to explain what happened to lamp 3 when student used it in the circuit.
		[2]
(d)	(i)	Use data from Fig. 1.1 and Fig. 1.3 to suggest a reason why lamp 1 gave only a dim light.
		[1]
	(ii)	Calculate the power in watts of lamp 2 , using data from Fig. 1.3.
		power of lamp 2 =watts [2]

Please turn over for Question 2.

2 Potassium manganate(VII) (potassium permanganate) is a dark crystalline substance. Its solution in water is dark purple.

Potassium permanganate solution reacts with solution \mathbf{X} . When the reaction is complete the purple colour disappears.

For Examiner's Use

A student uses a dropping pipette and solution \mathbf{X} to find out which one of three potassium permanganate solutions, \mathbf{A} , \mathbf{B} or \mathbf{C} is the most concentrated. The apparatus is shown in Fig. 2.1.

potassium permanganate solutions

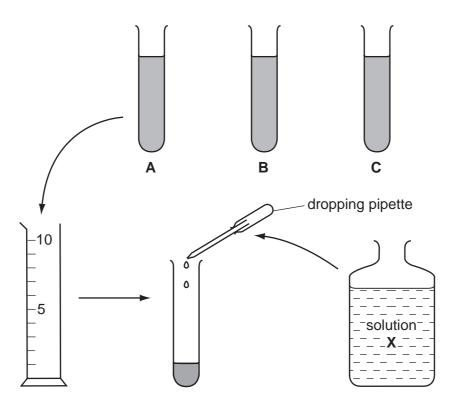

Fig. 2.1

Procedure

- She measures out some of solution **A** and pours it into a test-tube.
- She fills the dropping pipette with solution **X**.
- She adds solution **X** drop by drop to solution **A**, counting the drops, until the reaction has finished.
- She records the number of drops added in Fig. 2.2.
- She repeats the experiment using solutions B and C.

solution	number of drops used
A	15
В	24
С	18

Fig. 2.2

(a) ((i) What must the stude A, B and C?	nt do to make a fair compariso	on between the three solutions
			[1]
(ii) How will she make so other when the drops	0 1	es come into contact with each
			[1]
(i	ii) How will she know wh	nen to stop adding the drops of	solution X?
			[1]
(i	v) Which is the most cor	ncentrated of the solutions, A, E	3 or C?
			[1]
	Suggest a way, using the drop of liquid from the team		ng the accurate volume of one
•			
•			[2]
(c) -	The student carries out te	sts on solution X . She writes th	e results in Fig. 2.3.
(Complete Fig. 2.3.		
	test	observation	conclusion
(i)	To 2 cm ³ of solution X , add a few drops of		solution X contains sulfate

X, add a few drops of dilute hydrochloric acid followed by aqueous barium chloride.

(ii) To 2 cm³ of solution X, add aqueous sodium hydroxide until no further change occurs.

[1] solution X contains sulfate ions

solution X contains sulfate ions

solution X contains sulfate ions

Fig. 2.3

The student wants to discover the product of the reaction of solution ${\bf X}$ with potassium permanganate.

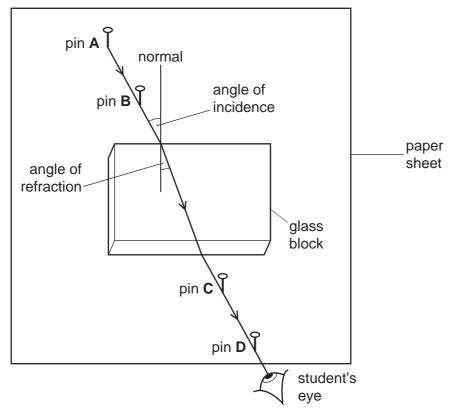

For Examiner's Use

She places 2 cm³ of potassium permanganate solution in a test-tube. She adds dilute sulfuric acid. Then she carefully adds solution **X** drop by drop until the reaction is complete. To the mixture, she adds aqueous sodium hydroxide until no further change occurs. She observes a brown precipitate.

(d)	(i)	Suggest the name of this brown precipitate.	
			[1]
	(ii)	What happens to the iron(II) ions when they react with potassium permanganate	?
			[1]

Please turn over for Question 3.

3 A student is investigating the path of a light ray through a parallel-sided glass block as shown in Fig. 3.1. Look at Fig. 3.1.

- Fig. 3.1
- He places the glass block on a sheet of paper on top of a flat piece of soft wood.
- He draws a line on the paper all round the glass block.
- He places two upright pins, **A** and **B**, in a line, at an angle to the side of the block.
- Then he looks through the glass block at the two pins.
- When he sees the two pins **A** and **B** in line, he places pins **C** and **D** on his side of the block, in line with pins **A** and **B**.
- He removes the glass block and draws the path of a ray of light through the block.

Fig. 3.2 shows the piece of paper after the glass block has been removed.

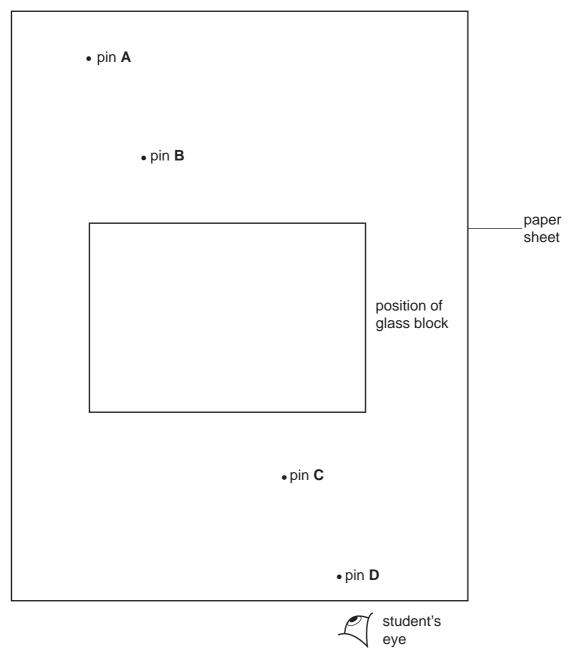

Fig. 3.2

- (a) (i) On Fig. 3.2, draw the path of a light ray that travels from pin A through the glass block into the student's eye. [1]
 - (ii) Draw the normal where the incident ray enters the glass block. See Fig. 3.1. [1]
 - (iii) On Fig. 3.2, label i, the angle of incidence, and r, the angle of refraction. [1]
 - (iv) On Fig. 3.2, measure i, the angle of incidence and r, the angle of refraction to the nearest degree. Record them in the first line of Fig. 3.3, on page 12. [2]

The student repeats the experiment, changing the angle of incidence each time, to give four more sets of readings. He records them in Fig. 3.3.

angle of incidence i/degrees angle of refraction r/degrees

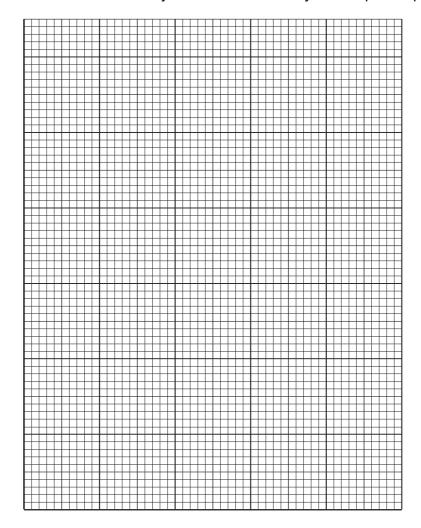

38 24
46 28
54 32
63 35

For Examiner's Use

Fig. 3.3

(b) On the graph grid provided, plot a graph of **i** (vertical axis) against **r**. Draw a smooth curve. Do not try to extend the line beyond the plotted points.

[3]

(c)	Use your graph to determine the angle of incidence when the angle of refraction is 26°.	١
	Show how you do this on the graph.	l
		п

angle of incidence = _____degrees [2]

4 The science class is doing experiments with Bunsen burners. The gas used in the burners is butane, C_4H_{10} .

A student finds out that he can get three different types of flame using his Bunsen burner. These are shown in Fig. 4.1.

For Examiner's Use

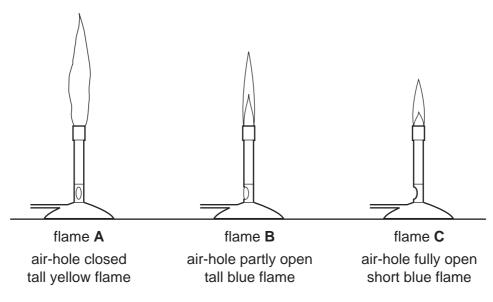

Fig. 4.1

(a) He holds a thin white card horizontally in each flame for about 5 seconds, as shown in Fig. 4.2. The results are shown in Fig. 4.3.

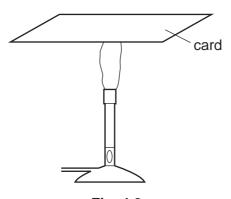

Fig. 4.2

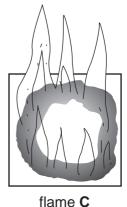

flame **A**there is a black powder on the card

flame **B**there is a partly-burned ring

Fig. 4.3

the card bursts into flames

	13
(i)	Explain why black soot forms on the card in flame A .
	[2]
(ii)	Suggest why there is a partly-burned ring with an unburned centre, on the card that was held in flame ${\bf B}$.
	[2]
The stu	cher gives the student a sample of sodium nitrate crystals in a test-tube. dent heats the tube in each flame for 3 minutes, beginning with flame A . shows the results.

Fig. 4.4

flame **B**

a liquid

is formed

(b) Use **one word** in each case to suggest what happens to the sodium nitrate when it is heated.

(i)	In flame B , the sodium nitrate		[1]
-----	--	--	----	---

flame **C** bubbles are

given off

(ii) In flame C, the sodium nitrate [1]

For Examiner's Use

flame A

crystals do

not change

(c)	The student thinks that oxygen is being given off from the sodium nitrate in flame C .
	Explain how he can show that the gas given off is oxygen. Give all necessary details of the test.
	[2]
	[2]
(d)	The teacher asks the student to explain why flame C is hotter than the other flames.
	Suggest why flame C is the hottest.
	[2]

5 Two students want to find out how high they can hit a ball.
While student a hits a ball as high as he can into the air, student B uses a stopclock. He starts the clock when the ball is hit and stops it when the ball hits the ground t seconds

For Examiner's Use

Fig. 5.1 shows how the ball moves through the air.

later. Then student **B** hits the ball and student **A** uses the stopclock.

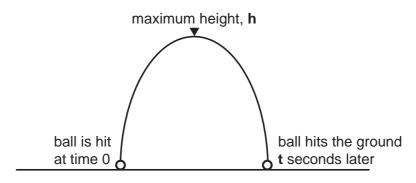

Fig. 5.1

They record time t for each student's ball in Fig. 5.2.

The students decide that the ball takes $\frac{t}{2}$ seconds to fall from the maximum height, h, to the ground.

student	Α	В
time t /s		
time, $\frac{\mathbf{t}}{2}$, to fall from height \mathbf{h} to the ground/s		

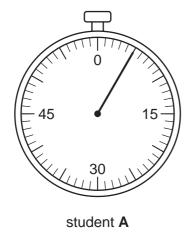

Fig. 5.2

- (a) Fig. 5.3 shows the stopclock dials for each student's ball.
 - (i) Read the dials and record the readings in Fig. 5.2.

[1]

(ii) Complete Fig. 5.2.

[1]

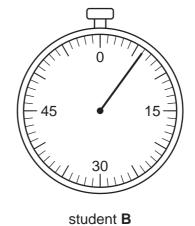

Fig. 5.3

The students know that the acceleration due to gravity, \mathbf{g} , has a value of about 10 m/s². They use this fact to draw a speed-time graph, shown in Fig. 5.4. This shows how the speed of the ball changes as it falls from the maximum height, \mathbf{h} , to the ground.

For Examiner's Use

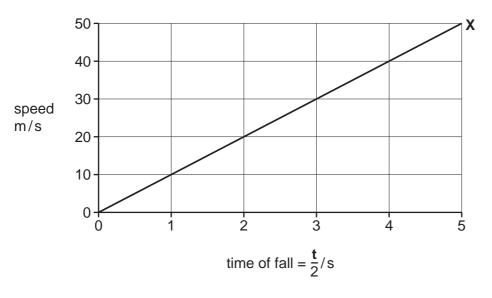

Fig. 5.4

- (b) (i) On Fig. 5.4, Draw a vertical line for the time of fall of student A's ball so that it meets the line **OX**. [1]
 - (ii) Find the distance travelled by student A's ball by calculating the area enclosed under the graph. This is equal to the maximum height, h, of the ball.

maximum height of student **A**'s ball = m [2]

(iii) In the same way, find the maximum height of student B's ball.

maximum height of student **B**'s ball = _____ m [2]

` '	c) The ball was given energy by the student. Describe the energy changes by completing the paragraph below.		g
The stu	dent's body used	energy when hitting the ball.	
The ba	ll gained	energy when it was hit. At the	
maximu	um height h , the ball possessed	energy.	
This wa	as changed into	energy just before the ball	
hit the	ground. The energy was converted i	ntoenergy and	
	energy when th	e ball hit the ground. [3	3]

6 A student investigated the reactions of the alkali metals lithium, sodium and potassium with cold water.

For Examiner's Use

- He took a piece of lithium out of the jar.
- He wiped off the mineral oil.
- He cut a small piece of lithium.
- He placed the piece of lithium on the surface of water in a large container. See Fig. 6.1.
- He wrote his observations in Fig. 6.2.
- He repeated the experiment using sodium and potassium.

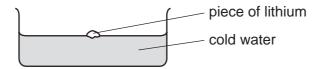

Fig. 6.1

alkali metal	observations
lithium	The lithium floated and moved around on the surface. A fizzing was heard. The lithium did not melt. It took 30 seconds to react and disappear.
sodium	The sodium reacted more vigorously than the lithium.
potassium	The potassium reacted more vigorously than the sodium.

Fig. 6.2

(a)	Suggest two observations that the student could make to show that the sodium reacted
	more vigorously than the lithium.

1	
_	ro
7	12

(b) Suggest **one** observation that the student could make to show that the potassium reacted more vigorously than the sodium.

[1]

(c)	The student thought that a gas was given off when lithium reacted with water.	
	Draw a diagram of the apparatus he can use to react a piece of lithium with cold water and collect the gas given off.	
	and	collect the gas given on.
		[2]
(d)	/i\	Write a word equation for the reaction of codium with cold water
(u)	(1)	Write a word equation for the reaction of sodium with cold water.
		rol
		[2]
	(ii)	Describe tests that can be used to confirm the presence of the two products of the reaction in (d)(i) , one test for each product.
		[3]
