IB05 11_0653_05/RP © UCLES 2005

1 (a) (i) You are going to do tests on seeds at two different stages of germination.

The seeds labelled **A** have been soaking for a few hours. Crush them with a little water on a white tile using the end of a glass rod.

Move a small quantity of the crushed seeds towards one corner of the white tile and test them with a few drops of iodine solution, making sure that the iodine does not touch the rest of the crushed seeds.

colour observed with iodine solution

- (ii) Transfer the remainder of the crushed seeds into a test-tube. Add an equal volume of Benedict's solution to test for reducing sugar and heat in a water bath for 5 minutes. Wash the white tile while you wait.

colour observed with Benedict's solution		•
conclusion		
	[2	2]

(b) (i) The seeds labelled **B** have been germinating for a few days.

Remove the roots and shoots (coleoptiles) from the seeds. Crush the seeds on the white tile and test them with Benedict's solution as described in **a(ii)** above.

colour observed with Benedict's solution	 ••••
conclusion	
	 [2]

(ii)	Compare the results in (a)(ii) and (b)(i). Explain any difference that you observed.
	[4]

[1]

2 You are going to investigate whether the mass of a pendulum has any effect on the time of swing. A pendulum consists of a weight on a piece of string that can swing from side to side.

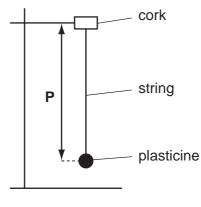

Fig. 2.1

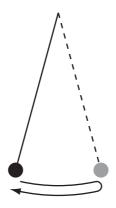

(a) Attach the string to the plasticine. Weigh the string and plasticine to the nearest gram and record its mass in the table Fig. 2.3.

Adjust the length of the string to between 450 and 550 mm and set up the apparatus as shown in Fig. 2.1.

(b) Measure and record the length **P** of the pendulum, in millimetres, from the clamp to the centre of the plasticine.

P = _____mm

You are now going to time to the nearest second, 20 continuous swings of the pendulum. One complete swing is shown in Fig. 2.2.

1 complete swing

Fig. 2.2

(c) Pull the plasticine about 5 cm to one side and release it. At the same time start the clock and measure the time for 20 complete swings. Record the time to the nearest second in Fig. 2.3.

5

- (d) (i) Remove about 10 g of plasticine and weigh the string and plasticine again to the nearest gram. Record this mass in Fig. 2.3.
 - (ii) Set up the pendulum again, making sure that the length **P** is the same as that used in (b). Start the pendulum as in part (c) and measure the time for 20 complete swings. Record this time in Fig. 2.3.
- (e) (i) Repeat (d)(i) and (ii) until you have 5 sets of readings. Remember to weigh the string and plasticine to the nearest gram and record the time to the nearest second.
 - (ii) Calculate the time for 1 complete swing for each of the five masses and record the times in Fig. 2.3. [1]

mass of plasticine/g	time for 20 complete swings/s	time for 1 complete swing/s

Fig. 2.3

[3]

- (f) Plot a graph of time for 1 swing (vertical axis) against mass of pendulum and draw a suitable line through your points. [4]
 - (g) What do your results show about the effect of changing the mass of the pendulum on the time of swing? Explain your answer.

[1]

out the following tests, which include testing for gases. Chemistry practical notes are provided on page 12. (a) Place about half the sample of A provided into a dry hard glass test-tube and heat until a change is visible. Whilst continuing to heat, test any gas given off with limewater. Allow the remaining solid to cool and include its colour in the space below. (i) Describe any visible change in the appearance of solid **A**.[1] (ii) What is the appearance of the residue when cold? [1] (iii) What change, if any, did you see in the limewater. [1] (iv) Name any gas given off. [1] (v) What can you deduce about the solid A? [1]

You are provided with two solids, A and B, both of which decompose when heated. Carry

3

Examiner's (c) Place solid **B** provided into a hard glass test-tube and heat gently at first and then very strongly. Whilst heating strongly, note any visible changes taking place and test any gas given off with moist blue litmus paper. What did you observe when (i) solid B was heated, [2] (ii) moist blue litmus paper was used? [1] (d) Solid B is known to be a compound of iron. Carry out a test of your own to decide whether **B** is an iron(II) or an iron(III) compound. Describe the test. State the result and your conclusion. [2]

CHEMISTRY PRACTICAL NOTES

Test for anions

anion	test	test result
carbonate (CO ₃ ²⁻)	add dilute acid	effervescence, carbon dioxide produced
chloride (C <i>l</i> -) [in solution]	acidify with dilute nitric acid, then add aqueous silver nitrate	white ppt.
nitrate (NO ₃ ⁻) [in solution]	add aqueous sodium hydroxide then aluminium foil; warm carefully	ammonia produced
sulphate (SO ₄ ^{2–}) [in solution]	acidify, then add aqueous barium chloride <i>or</i> aqueous barium nitrate	white ppt.

Test for aqueous cations

cation	effect of aqueous sodium hydroxide	effect of aqueous ammonia
ammonium (NH_4^+)	ammonia produced on warming	-
copper(II) (Cu ²⁺)	light blue ppt., insoluble in excess	light blue ppt., soluble in excess, giving a dark blue solution
iron(II) (Fe ²⁺)	green ppt., insoluble in excess	green ppt., insoluble in excess
iron(III) (Fe ³⁺)	red-brown ppt., insoluble in excess	red-brown ppt., insoluble in excess
zinc (Zn ²⁺)	white ppt., soluble in excess, giving a colourless solution	white ppt., soluble in excess, giving a colourless solution

Test for gases

gas	test and test result
ammonia (NH ₃)	turns damp litmus paper blue
carbon dioxide (CO ₂)	turns limewater milky
chlorine (Cl ₂)	bleaches damp litmus paper
hydrogen (H ₂)	'pops' with a lighted splint
oxygen (O ₂)	relights a glowing splint
